# Chapter 1

## Applications of Jensen's inequality

In this chapter,  $h$  denotes the function  $h(x) := x \log \frac{1}{x}$  for  $x \in [0, 1]$ .

**Lemma 1.1** (Concavity).  $h$  is strictly concave on  $[0, \infty)$ .

*Proof.* Check that  $h'$  is strictly monotone decreasing.  $\square$

**Lemma 1.2** (Jensen). If  $S$  is a finite set, and  $\sum_{s \in S} w_s = 1$  for some non-negative  $w_s$ , and  $p_s \in [0, 1]$  for all  $s \in S$ , then

$$\sum_{s \in S} w_s h(p_s) \leq h\left(\sum_{s \in S} w_s p_s\right).$$

*Proof.* Apply Jensen and Lemma 1.1.  $\square$

**Lemma 1.3** (Converse Jensen). If equality holds in the above lemma, then  $p_s = \sum_{s \in S} w_s h(p_s)$  whenever  $w_s \neq 0$ .

*Proof.* Need some converse form of Jensen, not sure if it is already in Mathlib. May also wish to state it as an if and only if.  $\square$

**Lemma 1.4** (log sum inequality). If  $S$  is a finite set, and  $a_s, b_s$  are non-negative for  $s \in S$ , then

$$\sum_{s \in S} a_s \log \frac{a_s}{b_s} \geq \left(\sum_{s \in S} a_s\right) \log \frac{\sum_{s \in S} a_s}{\sum_{s \in S} b_s},$$

with the convention  $0 \log \frac{0}{b} = 0$  for any  $b \geq 0$  and  $0 \log \frac{a}{0} = \infty$  for any  $a > 0$ .

*Proof.* Let  $B := \sum_{s \in S} b_s$ . Apply Jensen and Lemma 1.1 to show that  $\sum_{s \in S} \frac{b_s}{B} h\left(\frac{a_s}{b_s}\right) \geq h\left(\frac{\sum_{s \in S} a_s}{B}\right)$ .  $\square$

**Lemma 1.5** (converse log sum). If equality holds in Lemma 1.4, then  $a_s = r \cdot b_s$  for every  $s \in S$ , for some constant  $r \in \mathbb{R}$ .

*Proof.* By the fact that  $h$  is strictly concave and the equality condition of Jensen.  $\square$

## Chapter 2

# Shannon entropy inequalities

Random variables in this paper are measurable maps  $X : \Omega \rightarrow S$  from a probability space  $\Omega$  to a measurable space  $S$ , and called  $S$ -valued random variables. In many cases we will assume that singletons in  $S$  are measurable. Often we will restrict further to the case when  $S$  is finite with the discrete  $\sigma$ -algebra, which of course implies that  $S$  has measurable singletons.

**Definition 2.1** (Entropy). *If  $X$  is an  $S$ -valued random variable, the entropy  $\mathbb{H}[X]$  of  $X$  is defined*

$$\mathbb{H}[X] := \sum_{s \in S} \mathbb{P}[X = s] \log \frac{1}{\mathbb{P}[X = s]}$$

with the convention that  $0 \log \frac{1}{0} = 0$ .

**Lemma 2.2** (Entropy and relabeling).

(i) *If  $X : \Omega \rightarrow S$  and  $Y : \Omega \rightarrow T$  are random variables, and  $Y = f(X)$  for some injection  $f : S \rightarrow T$ , then  $\mathbb{H}[X] = \mathbb{H}[Y]$ .*

(ii) *If  $X : \Omega \rightarrow S$  and  $Y : \Omega \rightarrow T$  are random variables, and  $Y = f(X)$  and  $X = g(Y)$  for some functions  $f : S \rightarrow T$ ,  $g : T \rightarrow S$ , then  $\mathbb{H}[X] = \mathbb{H}[Y]$ .*

*Proof.* Expand out both entropies and rearrange. □

**Lemma 2.3** (Jensen bound). *If  $X$  is an  $S$ -valued random variable, then  $\mathbb{H}[X] \leq \log |S|$ .*

*Proof.* This is a direct consequence of Lemma 1.2. □

**Definition 2.4** (Uniform distribution). *If  $H$  is a subset of  $S$ , an  $S$ -random variable  $X$  is said to be uniformly distributed on  $H$  if  $\mathbb{P}[X = s] = 1/|H|$  for  $s \in H$  and  $\mathbb{P}[X = s] = 0$  otherwise.*

**Lemma 2.5** (Uniform distributions exist). *Given a finite non-empty subset  $H$  of a set  $S$ , there exists a random variable  $X$  (on some probability space) that is uniformly distributed on  $H$ .*

*Proof.* Direct construction. □

**Lemma 2.6** (Entropy of uniform random variable). *If  $X$  is  $S$ -valued random variable, then  $\mathbb{H}[X] = \log |S|$  if and only if  $X$  is uniformly distributed on  $S$ .*

*Proof.* Direct computation in one direction. Converse direction needs Lemma 1.3.  $\square$

**Lemma 2.7** (Entropy of uniform random variable, II). *If  $X$  is uniformly distributed on  $H$ , then, then  $\mathbb{H}[X] = \log |H|$ .*

*Proof.* Direct computation.  $\square$

**Lemma 2.8** (Bounded entropy implies concentration). *If  $X$  is an  $S$ -valued random variable, then there exists  $s \in S$  such that  $\mathbb{P}[X = s] \geq \exp(-\mathbb{H}[X])$ .*

*Proof.* We have

$$\mathbb{H}[X] = \sum_{s \in S} \mathbb{P}[X = s] \log \frac{1}{\mathbb{P}[X = s]} \geq \min_{s \in S} \log \frac{1}{\mathbb{P}[X = s]}$$

and the claim follows.  $\square$

We use  $X, Y$  to denote the pair  $\omega \mapsto (X(\omega), Y(\omega))$ .

**Lemma 2.9** (Commutativity and associativity of joint entropy). *If  $X : \Omega \rightarrow S$ ,  $Y : \Omega \rightarrow T$ , and  $Z : \Omega \rightarrow U$  are random variables, then  $\mathbb{H}[X, Y] = \mathbb{H}[Y, X]$  and  $\mathbb{H}[X, (Y, Z)] = \mathbb{H}[(X, Y), Z]$ .*

*Proof.* Set up an injection from  $(X, Y)$  to  $(Y, X)$  and use Lemma 2.2 for the first claim. Similarly for the second claim.  $\square$

**Definition 2.10** (Conditioned event). *If  $X : \Omega \rightarrow S$  is an  $S$ -valued random variable and  $E$  is an event in  $\Omega$ , then the conditioned event  $(X|E)$  is defined to be the same random variable as  $X$ , but now the ambient probability measure has been conditioned to  $E$ .*

Note: it may happen that  $E$  has zero measure. In which case, the ambient probability measure should be replaced with a zero measure. (In our formalization we achieve this by working with arbitrary measures, and normalizing them to be probability measures if possible, else using the zero measure. Conditioning is also formalized using existing Mathlib definitions.)

**Definition 2.11** (Conditional entropy). *If  $X : \Omega \rightarrow S$  and  $Y : \Omega \rightarrow T$  are random variables, the conditional entropy  $\mathbb{H}[X|Y]$  is defined as*

$$\mathbb{H}[X|Y] := \sum_{y \in Y} \mathbb{P}[Y = y] \mathbb{H}[(X|Y = y)].$$

**Lemma 2.12** (Conditional entropy and relabeling). *If  $X : \Omega \rightarrow S$ ,  $Y : \Omega \rightarrow T$ , and  $Z : \Omega \rightarrow U$  are random variables, and  $Y = f(X, Z)$  almost surely for some map  $f : S \times U \rightarrow T$  that is injective for each fixed  $U$ , then  $\mathbb{H}[X|Z] = \mathbb{H}[Y|Z]$ .*

*Similarly, if  $g : T \rightarrow U$  is injective, then  $\mathbb{H}[X|g(Y)] = \mathbb{H}[X|Y]$ .*

*Proof.* For the first part, use Definition 2.11 and then Lemma 2.2. The second part is a direct computation.  $\square$

**Lemma 2.13** (Chain rule). *If  $X : \Omega \rightarrow S$  and  $Y : \Omega \rightarrow T$  are random variables, then*

$$\mathbb{H}[X, Y] = \mathbb{H}[Y] + \mathbb{H}[X|Y].$$

*Proof.* Direct computation.  $\square$

**Lemma 2.14** (Conditional chain rule). *If  $X : \Omega \rightarrow S$ ,  $Y : \Omega \rightarrow T$ ,  $Z : \Omega \rightarrow U$  are random variables, then*

$$\mathbb{H}[X, Y|Z] = \mathbb{H}[Y|Z] + \mathbb{H}[X|Y, Z].$$

*Proof.* For each  $z \in U$ , we can apply Lemma 2.13 to the random variables  $(X|Z = z)$  and  $(Y|Z = z)$  to obtain

$$\mathbb{H}[(X|Z = z), (Y|Z = z)] = \mathbb{H}[Y|Z = z] + \mathbb{H}[(X|Z = z)|(Y|Z = z)].$$

Now multiply by  $\mathbb{P}[Z = z]$  and sum. Some helper lemmas may be needed to get to the form above. This sort of “average over conditioning” argument to get conditional entropy inequalities from unconditional ones is commonly used in this paper.  $\square$

**Definition 2.15** (Mutual information). *If  $X : \Omega \rightarrow S$ ,  $Y : \Omega \rightarrow T$  are random variables, then*

$$\mathbb{I}[X : Y] := \mathbb{H}[X] + \mathbb{H}[Y] - \mathbb{H}[X, Y].$$

**Lemma 2.16** (Alternative formulae for mutual information). *With notation as above, we have*

$$\begin{aligned} \mathbb{I}[X : Y] &= \mathbb{I}[Y : X] \\ \mathbb{I}[X : Y] &= \mathbb{H}[X] - \mathbb{H}[X|Y] \\ \mathbb{I}[X : Y] &= \mathbb{H}[Y] - \mathbb{H}[Y|X] \end{aligned}$$

*Proof.* Immediate from Lemmas 2.9, 2.13.  $\square$

**Lemma 2.17** (Nonnegativity of mutual information). *We have  $\mathbb{I}[X : Y] \geq 0$ .*

*Proof.* An application of Lemma 1.2 and Lemma 2.16.  $\square$

**Corollary 2.18** (Subadditivity). *With notation as above, we have  $\mathbb{H}[X, Y] \leq \mathbb{H}[X] + \mathbb{H}[Y]$ .*

*Proof.* Use Lemma 2.17.  $\square$

**Corollary 2.19** (Conditioning reduces entropy). *With notation as above, we have  $\mathbb{H}[X|Y] \leq \mathbb{H}[X]$ .*

*Proof.* Combine Lemma 2.17 with Lemma 2.16.  $\square$

**Corollary 2.20** (Submodularity). *With three random variables  $X, Y, Z$ , one has  $\mathbb{H}[X|Y, Z] \leq \mathbb{H}[X|Z]$ .*

*Proof.* Apply the “averaging over conditioning” argument to Corollary 2.19.  $\square$

**Corollary 2.21** (Alternate form of submodularity). *With three random variables  $X, Y, Z$ , one has*

$$\mathbb{H}[X, Y, Z] + \mathbb{H}[Z] \leq \mathbb{H}[X, Z] + \mathbb{H}[Y, Z].$$

*Proof.* Apply Corollary 2.20 and Lemma 2.13.  $\square$

**Definition 2.22** (Independent random variables). *Two random variables  $X : \Omega \rightarrow S$  and  $Y : \Omega \rightarrow T$  are independent if the law of  $(X, Y)$  is the product of the law of  $X$  and the law of  $Y$ . Similarly for more than two variables.*

**Lemma 2.23** (Vanishing of mutual information). *If  $X, Y$  are random variables, then  $\mathbb{I}[X : Y] = 0$  if and only if  $X, Y$  are independent.*

*Proof.* An application of the equality case of Jensen's inequality, Lemma 1.3.  $\square$

**Corollary 2.24** (Additivity of entropy). *If  $X, Y$  are random variables, then  $\mathbb{H}[X, Y] = \mathbb{H}[X] + \mathbb{H}[Y]$  if and only if  $X, Y$  are independent.*

*Proof.* Direct from Lemma 2.23.  $\square$

**Definition 2.25** (Conditional mutual information). *If  $X, Y, Z$  are random variables, with  $Z$   $U$ -valued, then*

$$\mathbb{I}[X : Y|Z] := \sum_{z \in U} P[Z = z] \mathbb{I}[(X|Z = z) : (Y|Z = z)].$$

**Lemma 2.26** (Alternate formula for conditional mutual information). *We have*

$$\mathbb{I}[X : Y|Z] := \mathbb{H}[X|Z] + \mathbb{H}[Y|Z] - \mathbb{H}[X, Y|Z]$$

and

$$\mathbb{I}[X : Y|Z] := \mathbb{H}[X|Z] - \mathbb{H}[X|Y, Z].$$

*Proof.* Routine computation.  $\square$

**Lemma 2.27** (Nonnegativity of conditional mutual information). *If  $X, Y, Z$  are random variables, then  $\mathbb{I}[X : Y|Z] \geq 0$ .*

*Proof.* Use Definition 2.25 and Corollary 2.20.  $\square$

**Definition 2.28** (Conditionally independent random variables). *Two random variables  $X : \Omega \rightarrow S$  and  $Y : \Omega \rightarrow T$  are conditionally independent relative to another random variable  $Z : \Omega \rightarrow U$  if  $P[X = s \wedge Y = t|Z = u] = P[X = s|Z = u]P[Y = t|Z = u]$  for all  $s \in S, t \in T, u \in U$ . (We won't need conditional independence for more variables than this.)*

**Lemma 2.29** (Vanishing conditional mutual information). *If  $X, Y, Z$  are random variables, then  $\mathbb{I}[X : Y|Z] = 0$  iff  $X, Y$  are conditionally independent over  $Z$ .*

*Proof.* Immediate from Lemma 2.23 and Definition 2.28.  $\square$

**Corollary 2.30** (Entropy of conditionally independent variables). *If  $X, Y$  are conditionally independent over  $Z$ , then*

$$\mathbb{H}[X, Y, Z] = \mathbb{H}[X, Z] + \mathbb{H}[Y, Z] - \mathbb{H}[Z].$$

*Proof.* Immediate from Lemma 2.29 and Lemma 2.26.  $\square$

## Chapter 3

# Entropic Ruzsa calculus

In this section  $G$  will be a finite additive group. (May eventually want to generalize to infinite  $G$ .)

**Lemma 3.1** (Negation preserves entropy). *If  $X$  is  $G$ -valued, then  $\mathbb{H}[-X] = \mathbb{H}[X]$ .*

*Proof.* Immediate from Lemma 2.2. □

**Lemma 3.2** (Shearing preserves entropy). *If  $X, Y$  are  $G$ -valued, then  $\mathbb{H}[X \pm Y|Y] = \mathbb{H}[X|Y]$  and  $\mathbb{H}[X \pm Y, Y] = \mathbb{H}[X, Y]$ .*

*Proof.* Immediate from Lemma 2.12 and Lemma 2.13. □

**Lemma 3.3** (Lower bound of sumset). *If  $X, Y$  are  $G$ -valued random variables on  $\Omega$ , we have*

$$\max(\mathbb{H}[X], \mathbb{H}[Y]) - \mathbb{I}[X : Y] \leq \mathbb{H}[X \pm Y].$$

*Proof.* By Corollary 2.19, 3.2, 2.16, 3.1 we have

$$\mathbb{H}[X \pm Y] \geq \mathbb{H}[X \pm Y|Y] = \mathbb{H}[X|Y] = \mathbb{H}[X] - \mathbb{I}[X : Y]$$

and similarly with the roles of  $X, Y$  reversed, giving the claim. □

**Corollary 3.4** (Conditional lower bound on sumset). *If  $X, Y$  are  $G$ -valued random variables on  $\Omega$  and  $Z$  is another random variable on  $\Omega$  then*

$$\max(\mathbb{H}[X|Z], \mathbb{H}[Y|Z]) - \mathbb{I}[X : Y|Z] \leq \mathbb{H}[X \pm Y|Z],$$

*Proof.* This follows from Lemma 3.3 by conditioning to  $Z = z$  and summing over  $z$  (weighted by  $\mathbb{P}[Z = z]$ ). □

**Corollary 3.5** (Independent lower bound on sumset). *If  $X, Y$  are independent  $G$ -valued random variables, then*

$$\max(\mathbb{H}[X], \mathbb{H}[Y]) \leq \mathbb{H}[X \pm Y].$$

*Proof.* Combine Lemma 3.3 with Lemma 2.23. □

One random variable is said to be a copy of another if they have the same distribution.

**Lemma 3.6** (Copy preserves entropy). *If  $X'$  is a copy of  $X$  then  $\mathbb{H}[X'] = \mathbb{H}[X]$ .*

*Proof.* Immediate from Definition 2.1.  $\square$

**Lemma 3.7** (Existence of independent copies). *Let  $X_i : \Omega_i \rightarrow S_i$  be random variables for  $i = 1, \dots, k$ . Then if one gives  $\prod_{i=1}^k S_i$  the product measure of the laws of  $X_i$ , the coordinate functions  $(x_j)_{j=1}^k \mapsto x_i$  are jointly independent random variables which are copies of the  $X_1, \dots, X_k$ .*

*Proof.* Explicit computation.  $\square$

**Definition 3.8** (Ruzsa distance). *Let  $X, Y$  be  $G$ -valued random variables (not necessarily on the same sample space). The Ruzsa distance  $d[X; Y]$  between  $X$  and  $Y$  is defined to be*

$$d[X; Y] := \mathbb{H}[X' - Y'] - \mathbb{H}[X']/2 - \mathbb{H}[Y']/2$$

where  $X', Y'$  are (the canonical) independent copies of  $X, Y$  from Lemma 3.7.

**Lemma 3.9** (Distance from zero). *If  $X$  is a  $G$ -valued random variable and  $0$  is the random variable taking the value  $0$  everywhere then*

$$d[X; 0] = \mathbb{H}(X)/2.$$

*Proof.* This is an immediate consequence of the definitions and  $X - 0 \equiv X$  and  $\mathbb{H}(0) = 0$ .  $\square$

**Lemma 3.10** (Copy preserves Ruzsa distance). *If  $X', Y'$  are copies of  $X, Y$  respectively then  $d[X'; Y'] = d[X; Y]$ .*

*Proof.* Immediate from Definitions 3.8 and Lemma 3.6.  $\square$

**Lemma 3.11** (Ruzsa distance in independent case). *If  $X, Y$  are independent  $G$ -random variables then*

$$d[X; Y] := \mathbb{H}[X - Y] - \mathbb{H}[X]/2 - \mathbb{H}[Y]/2.$$

*Proof.* Immediate from Definition 3.8 and Lemmas 2.2, 3.6.  $\square$

**Lemma 3.12** (Distance symmetric). *If  $X, Y$  are  $G$ -valued random variables, then*

$$d[X; Y] = d[Y; X].$$

*Proof.* Immediate from Lemma 3.1 and Definition 3.8.  $\square$

**Lemma 3.13** (Distance controls entropy difference). *If  $X, Y$  are  $G$ -valued random variables, then*

$$|\mathbb{H}[X] - \mathbb{H}[Y]| \leq 2d[X; Y].$$

*Proof.* Immediate from Corollary 3.5 and Definition 3.8, and also Lemma 3.1.  $\square$

**Lemma 3.14** (Distance controls entropy growth). *If  $X, Y$  are independent  $G$ -valued random variables, then*

$$\mathbb{H}[X - Y] - \mathbb{H}[X], \mathbb{H}[X - Y] - \mathbb{H}[Y] \leq 2d[X; Y].$$

*Proof.* Immediate from Corollary 3.5 and Definition 3.8, and also Lemma 3.1.  $\square$

**Lemma 3.15** (Distance nonnegative). *If  $X, Y$  are  $G$ -valued random variables, then*

$$d[X; Y] \geq 0.$$

*Proof.* Immediate from Lemma 3.13. □

**Lemma 3.16** (Projection entropy and distance). *If  $G$  is an additive group and  $X$  is a  $G$ -valued random variable and  $H \leq G$  is a finite subgroup then, with  $\pi : G \rightarrow G/H$  the natural homomorphism we have (where  $U_H$  is uniform on  $H$ )*

$$\mathbb{H}(\pi(X)) \leq 2d[X; U_H].$$

*Proof.* WLOG, we make  $X, U_H$  independent (Lemma 3.7). Now by Lemmas 2.20, 3.2, 2.3

$$\begin{aligned} \mathbb{H}(X - U_H | \pi(X)) &\geq \mathbb{H}(X - U_H | X) &&= \mathbb{H}(U_H) \\ \mathbb{H}(X - U_H | \pi(X)) &\leq \log |H| &&= \mathbb{H}(U_H) \end{aligned}$$

By Lemma 2.13

$$\mathbb{H}(X - U_H) = \mathbb{H}(\pi(X)) + \mathbb{H}(X - U_H | \pi(X)) = \mathbb{H}(\pi(X)) + \mathbb{H}(U_H)$$

and therefore

$$d[X; U_H] = \mathbb{H}(\pi(X)) + \frac{\mathbb{H}(U_H) - \mathbb{H}(X)}{2}.$$

Furthermore by Lemma 3.13

$$d[X; U_H] \geq \frac{|\mathbb{H}(X) - \mathbb{H}(U_H)|}{2}.$$

Adding these inequalities gives the result. □

**Lemma 3.17** (Improved Ruzsa triangle inequality). *If  $X, Y, Z$  are  $G$ -valued random variables on  $\Omega$  with  $(X, Y)$  independent of  $Z$ , then*

$$\mathbb{H}[X - Y] \leq \mathbb{H}[X - Z] + \mathbb{H}[Z - Y] - \mathbb{H}[Z] \tag{3.1}$$

This is an improvement over the usual Ruzsa triangle inequality because  $X, Y$  are not assumed to be independent. However we will not utilize this improvement here.

*Proof.* Apply Corollary 2.21 to obtain

$$\mathbb{H}[X - Z, X - Y] + \mathbb{H}[Y, X - Y] \geq \mathbb{H}[X - Z, Y, X - Y] + \mathbb{H}[X - Y].$$

Using

$$\mathbb{H}[X - Z, X - Y] \leq \mathbb{H}[X - Z] + \mathbb{H}[Y - Z]$$

(from Lemma 2.2, Corollary 2.18),

$$\mathbb{H}[Y, X - Y] = \mathbb{H}[X, Y]$$

(from Lemma 2.2), and

$$\mathbb{H}[X - Z, Y, X - Y] = \mathbb{H}[X, Y, Z] = \mathbb{H}[X, Y] + \mathbb{H}[Z]$$

(from Lemma 2.2 and Corollary 2.24) and rearranging, we indeed obtain (3.1). □

**Lemma 3.18** (Ruzsa triangle inequality). *If  $X, Y, Z$  are  $G$ -valued random variables, then*

$$d[X; Y] \leq d[X; Z] + d[Z; Y].$$

*Proof.* By Lemma 3.10 and Lemmas 3.7, 3.11, it suffices to prove this inequality assuming that  $X, Y, Z$  are defined on the same space and are independent. But then the claim follows from Lemma 3.17 and Definition 3.8.  $\square$

**Definition 3.19** (Conditioned Ruzsa distance). *If  $(X, Z)$  and  $(Y, W)$  are random variables (where  $X$  and  $Y$  are  $G$ -valued) we define*

$$d[X|Z; Y|W] := \sum_{z,w} \mathbb{P}[Z = z] \mathbb{P}[W = w] d[(X|Z = z); (Y|(W = w))].$$

similarly

$$d[X; Y|W] := \sum_w \mathbb{P}[W = w] d[X; (Y|(W = w))].$$

**Lemma 3.20** (Alternate form of distance). *The expression  $d[X|Z; Y|W]$  is unchanged if  $(X, Z)$  or  $(Y, W)$  is replaced by a copy. Furthermore, if  $(X, Z)$  and  $(Y, W)$  are independent, then*

$$d[X|Z; Y|W] = \mathbb{H}[X - Y|Z, W] - \mathbb{H}[X|Z]/2 - \mathbb{H}[Y|W]/2$$

and similarly

$$d[X; Y|W] = \mathbb{H}[X - Y|W] - \mathbb{H}[X]/2 - \mathbb{H}[Y|W]/2.$$

*Proof.* Straightforward thanks to Lemma 3.6, Lemma 3.10, Lemma 3.11, Definition 3.19, Definition 2.11.  $\square$

**Lemma 3.21** (Kaimanovich-Vershik-Madiman inequality). *Suppose that  $X, Y, Z$  are independent  $G$ -valued random variables. Then*

$$\mathbb{H}[X + Y + Z] - \mathbb{H}[X + Y] \leq \mathbb{H}[Y + Z] - \mathbb{H}[Y].$$

*Proof.* From Corollary 2.20 we have

$$\mathbb{H}[X, X + Y + Z] + \mathbb{H}[Z, X + Y + Z] \geq \mathbb{H}[X, Z, X + Y + Z] + \mathbb{H}[X + Y + Z].$$

However, using Lemmas 2.24, 2.2 repeatedly we have  $\mathbb{H}[X, X + Y + Z] = \mathbb{H}[X, Y + Z] = \mathbb{H}[X] + \mathbb{H}[Y + Z]$ ,  $\mathbb{H}[Z, X + Y + Z] = \mathbb{H}[Z, X + Y] = \mathbb{H}[Z] + \mathbb{H}[X + Y]$  and  $\mathbb{H}[X, Z, X + Y + Z] = \mathbb{H}[X, Y, Z] = \mathbb{H}[X] + \mathbb{H}[Y] + \mathbb{H}[Z]$ . The claim then follows from a calculation.  $\square$

**Lemma 3.22** (Existence of conditional independent trials). *For  $X, Y$  random variables, there exist random variables  $X_1, X_2, Y'$  on a common probability space with  $(X_1, Y')$ ,  $(X_2, Y')$  both having the distribution of  $(X, Y)$ , and  $X_1, X_2$  conditionally independent over  $Y'$  in the sense of Definition 2.28.*

*Proof.* Explicit construction.  $\square$

**Lemma 3.23** (Balog-Szemerédi-Gowers). *Let  $A, B$  be  $G$ -valued random variables on  $\Omega$ , and set  $Z := A + B$ . Then*

$$\sum_z \mathbb{P}[Z = z] d[(A|Z = z); (B|Z = z)] \leq 3\mathbb{I}[A : B] + 2\mathbb{H}[Z] - \mathbb{H}[A] - \mathbb{H}[B]. \quad (3.2)$$

*Proof.* Let  $(A_1, B_1)$  and  $(A_2, B_2)$  (and  $Z'$ , which by abuse of notation we call  $Z$ ) be conditionally independent trials of  $(A, B)$  relative to  $Z$  as produced by Lemma 3.22, thus  $(A_1, B_1)$  and  $(A_2, B_2)$  are coupled through the random variable  $A_1 + B_1 = A_2 + B_2$ , which by abuse of notation we shall also call  $Z$ .

Observe from Lemma 3.11 that the left-hand side of (3.2) is

$$\mathbb{H}[A_1 - B_2|Z] - \mathbb{H}[A_1|Z]/2 - \mathbb{H}[B_2|Z]/2. \quad (3.3)$$

since, crucially,  $(A_1|Z = z)$  and  $(B_2|Z = z)$  are independent for all  $z$ .

Applying submodularity (Corollary 2.21) gives

$$\begin{aligned} \mathbb{H}[A_1 - B_2] + \mathbb{H}[A_1 - B_2, A_1, B_1] \\ \leq \mathbb{H}[A_1 - B_2, A_1] + \mathbb{H}[A_1 - B_2, B_1]. \end{aligned} \quad (3.4)$$

We estimate the second, third and fourth terms appearing here. First note that, by Corollary 2.30 and Lemma 2.2 (noting that the tuple  $(A_1 - B_2, A_1, B_1)$  determines the tuple  $(A_1, A_2, B_1, B_2)$  since  $A_1 + B_1 = A_2 + B_2$ )

$$\mathbb{H}[A_1 - B_2, A_1, B_1] = \mathbb{H}[A_1, B_1, A_2, B_2, Z] = 2\mathbb{H}[A, B] - \mathbb{H}[Z]. \quad (3.5)$$

Next observe that

$$\mathbb{H}[A_1 - B_2, A_1] = \mathbb{H}[A_1, B_2] \leq \mathbb{H}[A] + \mathbb{H}[B]. \quad (3.6)$$

Finally, we have

$$\mathbb{H}[A_1 - B_2, B_1] = \mathbb{H}[A_2 - B_1, B_1] = \mathbb{H}[A_2, B_1] \leq \mathbb{H}[A] + \mathbb{H}[B]. \quad (3.7)$$

Substituting (3.5), (3.6) and (3.7) into (3.4) yields

$$\mathbb{H}[A_1 - B_2] \leq 2\mathbb{I}[A : B] + \mathbb{H}[Z]$$

and so by Corollary 2.19

$$\mathbb{H}[A_1 - B_2|Z] \leq 2\mathbb{I}[A : B] + \mathbb{H}[Z].$$

Since

$$\begin{aligned} \mathbb{H}[A_1|Z] &= \mathbb{H}[A_1, A_1 + B_1] - \mathbb{H}[Z] \\ &= \mathbb{H}[A, B] - \mathbb{H}[Z] \\ &= \mathbb{H}[Z] - \mathbb{I}[A : B] - 2\mathbb{H}[Z] - \mathbb{H}[A] - \mathbb{H}[B] \end{aligned}$$

and similarly for  $\mathbb{H}[B_2|Z]$ , we see that (3.3) is bounded by  $3\mathbb{I}[A : B] + 2\mathbb{H}[Z] - \mathbb{H}[A] - \mathbb{H}[B]$  as claimed.  $\square$

**Lemma 3.24** (Upper bound on conditioned Ruzsa distance). *Suppose that  $(X, Z)$  and  $(Y, W)$  are random variables, where  $X, Y$  take values in an abelian group. Then*

$$d[X|Z; Y|W] \leq d[X; Y] + \frac{1}{2}\mathbb{I}[X : Z] + \frac{1}{2}\mathbb{I}[Y : W].$$

*In particular,*

$$d[X; Y|W] \leq d[X; Y] + \frac{1}{2}\mathbb{I}[Y : W].$$

*Proof.* Using Lemma 3.20 and Lemma 3.7, if  $(X', Z'), (Y', W')$  are independent copies of the variables  $(X, Z), (Y, W)$ , we have

$$\begin{aligned} d[X|Z; Y|W] &= \mathbb{H}[X' - Y'|Z', W'] - \frac{1}{2}\mathbb{H}[X'|Z'] - \frac{1}{2}\mathbb{H}[Y'|W'] \\ &\leq \mathbb{H}[X' - Y'] - \frac{1}{2}\mathbb{H}[X'|Z'] - \frac{1}{2}\mathbb{H}[Y'|W'] \\ &= d[X'; Y'] + \frac{1}{2}\mathbb{I}[X' : Z'] + \frac{1}{2}\mathbb{I}[Y' : W']. \end{aligned}$$

Here, in the middle step we used Corollary 2.19, and in the last step we used Definition 3.8 and Definition 2.15.  $\square$

**Lemma 3.25** (Comparison of Ruzsa distances, I). *Let  $X, Y, Z$  be random variables taking values in some abelian group of characteristic 2, and with  $Y, Z$  independent. Then we have*

$$\begin{aligned} d[X; Y + Z] - d[X; Y] &\leq \frac{1}{2}(\mathbb{H}[Y + Z] - \mathbb{H}[Y]) \\ &= \frac{1}{2}d[Y; Z] + \frac{1}{4}\mathbb{H}[Z] - \frac{1}{4}\mathbb{H}[Y]. \end{aligned} \quad (3.8)$$

and

$$\begin{aligned} d[X; Y|Y + Z] - d[X; Y] &\leq \frac{1}{2}(\mathbb{H}[Y + Z] - \mathbb{H}[Z]) \\ &= \frac{1}{2}d[Y; Z] + \frac{1}{4}\mathbb{H}[Y] - \frac{1}{4}\mathbb{H}[Z]. \end{aligned} \quad (3.9)$$

*Proof.* We first prove (3.8). We may assume (taking an independent copy, using Lemma 3.7 and Lemma 3.10, 3.11) that  $X$  is independent of  $Y, Z$ . Then we have

$$\begin{aligned} d[X; Y + Z] - d[X; Y] &= \mathbb{H}[X + Y + Z] - \mathbb{H}[X + Y] - \frac{1}{2}\mathbb{H}[Y + Z] + \frac{1}{2}\mathbb{H}[Y]. \end{aligned}$$

Combining this with Lemma 3.21 gives the required bound. The second form of the result is immediate Lemma 3.11.

Turning to (3.9), we have from Definition 2.15 and Lemma 2.2

$$\begin{aligned} \mathbb{I}[Y : Y + Z] &= \mathbb{H}[Y] + \mathbb{H}[Y + Z] - \mathbb{H}[Y, Y + Z] \\ &= \mathbb{H}[Y] + \mathbb{H}[Y + Z] - \mathbb{H}[Y, Z] = \mathbb{H}[Y + Z] - \mathbb{H}[Z], \end{aligned}$$

and so (3.9) is a consequence of Lemma 3.24. Once again the second form of the result is immediate from Lemma 3.11.  $\square$

**Lemma 3.26** (Comparison of Ruzsa distances, II). *Let  $X, Y, Z, Z'$  be random variables taking values in some abelian group, and with  $Y, Z, Z'$  independent. Then we have*

$$\begin{aligned} d[X; Y + Z|Y + Z + Z'] - d[X; Y] &\leq \frac{1}{2}(\mathbb{H}[Y + Z + Z'] + \mathbb{H}[Y + Z] - \mathbb{H}[Y] - \mathbb{H}[Z']). \end{aligned} \quad (3.10)$$

*Proof.* By Lemma 3.25 (with a change of variables) we have

$$d[X; Y + Z|Y + Z + Z'] - d[X; Y + Z] \leq \frac{1}{2}(\mathbb{H}[Y + Z + Z'] - \mathbb{H}[Z']).$$

Adding this to (3.8) gives the result.  $\square$

# Chapter 4

## The 100% version of PFR

**Definition 4.1** (Symmetry group). *If  $X$  is a  $G$ -valued random variable, then the symmetry group  $\text{Sym}[X]$  is the set of all  $h \in G$  such that  $X + h$  has the same distribution as  $X$ .*

**Lemma 4.2** (Symmetry group is a group). *If  $X$  is a  $G$ -valued random variable, then  $\text{Sym}[X]$  is a subgroup of  $G$ .*

*Proof.* Direct verification of the group axioms.  $\square$

**Lemma 4.3** (Zero Ruzsa distance implies large symmetry group). *If  $X$  is a  $G$ -valued random variable such that  $d[X; X] = 0$ , and  $x, y \in G$  are such that  $P[X = x], P[X = y] > 0$ , then  $x - y \in \text{Sym}[X]$ .*

*Proof.* Let  $X_1, X_2$  be independent copies of  $X$  (from Lemma 3.7). Let  $A$  denote the range of  $X$ . From Lemma 3.11 and Lemma 3.10 we have

$$\mathbb{H}[X_1 - X_2] = \mathbb{H}[X_1].$$

Observe from Lemma 2.12 that

$$\mathbb{H}[X_1 - X_2 | X_2] = \mathbb{H}[X_1 | X_2] = \mathbb{H}[X_1]$$

and hence by Lemma 2.16

$$\mathbb{I}[X_1 - X_2 : X_1] = 0.$$

By Lemma 2.23,  $X_1 - X_2$  and  $X_1$  are therefore independent, thus the law of  $(X_1 - X_2 | X_1 = x)$  does not depend on  $x \in A$ . The claim follows.  $\square$

**Lemma 4.4** (Translate is uniform on symmetry group). *If  $X$  is a  $G$ -valued random variable with  $d[X; X] = 0$ , and  $x_0$  is a point with  $P[X = x_0] > 0$ , then  $X - x_0$  is uniformly distributed on  $\text{Sym}[X]$ .*

*Proof.* The law of  $X - x_0$  is invariant under  $\text{Sym}[X]$ , non-zero at the origin, and supported on  $\text{Sym}[X]$ , giving the claim.  $\square$

**Lemma 4.5** (Symmetric 100% inverse theorem). *Suppose that  $X$  is a  $G$ -valued random variable such that  $d[X; X] = 0$ . Then there exists a subgroup  $H \leq G$  such that  $d[X; U_H] = 0$ .*

*Proof.* Take  $H$  to be the symmetry group of  $X$ , which is a group by Lemma 4.2. From Lemma 4.4,  $X - x_0$  is uniform on  $H$ , and  $d[X; X - x_0] = d[X; X] \leq 0$ , and the claim follows.  $\square$

**Corollary 4.6** (General 100% inverse theorem). *Suppose that  $X_1, X_2$  are  $G$ -valued random variables such that  $d[X_1; X_2] = 0$ . Then there exists a subgroup  $H \leq G$  such that  $d[X_1; U_H] = d[X_2; U_H] = 0$ .*

*Proof.* Using Lemma 3.18 and Lemma 3.15 we have  $d[X_1; X_1] = 0$ , hence by Lemma 4.5  $d[X_1; U_H] = 0$  for some subgroup  $H$ . By Lemma 3.18 and Lemma 3.15 again we also have  $d[X_2; U_H]$  as required.  $\square$

## Chapter 5

# The Fibring lemma

**Proposition 5.1** (General fibring identity). *Let  $\pi : H \rightarrow H'$  be a homomorphism additive groups, and let  $Z_1, Z_2$  be  $H$ -valued random variables. Then we have*

$$d[Z_1; Z_2] \geq d[\pi(Z_1); \pi(Z_2)] + d[Z_1 | \pi(Z_1); Z_2 | \pi(Z_2)].$$

Moreover, if  $Z_1, Z_2$  are taken to be independent, then the difference between the two sides is

$$I(Z_1 - Z_2 : (\pi(Z_1), \pi(Z_2)) | \pi(Z_1 - Z_2)).$$

*Proof.* Let  $Z_1, Z_2$  be independent throughout (this is possible by Lemma 3.10 and Lemma 3.7). By Lemma 3.20, We have

$$\begin{aligned} & d[Z_1 | \pi(Z_1); Z_2 | \pi(Z_2)] \\ &= \mathbb{H}[Z_1 - Z_2 | \pi(Z_1), \pi(Z_2)] - \frac{1}{2} \mathbb{H}[Z_1 | \pi(Z_1)] - \frac{1}{2} \mathbb{H}[Z_2 | \pi(Z_2)] \\ &\leq \mathbb{H}[Z_1 - Z_2 | \pi(Z_1 + Z_2)] - \frac{1}{2} \mathbb{H}[Z_1 | \pi(Z_1)] - \frac{1}{2} \mathbb{H}[Z_2 | \pi(Z_2)] \\ &= d[Z_1; Z_2] - d[\pi(Z_1); \pi(Z_2)]. \end{aligned}$$

In the middle step, we used Corollary 2.20, and in the last step we used the fact that

$$\mathbb{H}[Z_1 - Z_2 | \pi(Z_1 - Z_2)] = \mathbb{H}[Z_1 - Z_2] - \mathbb{H}[\pi(Z_1 - Z_2)]$$

(thanks to Lemma 2.13 and Lemma 2.2) and that

$$\mathbb{H}[Z_i | \pi(Z_i)] = \mathbb{H}[Z_i] - \mathbb{H}[\pi(Z_i)]$$

(since  $Z_i$  determines  $\pi(Z_i)$ ). This gives the claimed inequality. The difference between the two sides is precisely

$$\mathbb{H}[Z_1 - Z_2 | \pi(Z_1 - Z_2)] - \mathbb{H}[Z_1 - Z_2 | \pi(Z_1), \pi(Z_2)].$$

To rewrite this in terms of (conditional) mutual information, we use the identity

$$\mathbb{H}[A|B] - \mathbb{H}[A|B, C] = \mathbb{I}[A : C|B],$$

(which follows Lemma 2.26) taking  $A := Z_1 - Z_2$ ,  $B := \pi(Z_1 - Z_2)$  and  $C := (\pi(Z_1), \pi(Z_2))$ , and noting that in this case  $\mathbb{H}[A|B, C] = \mathbb{H}[A|C]$  since  $C$  uniquely determines  $B$  (this may require another helper lemma about entropy). This completes the proof.  $\square$

**Corollary 5.2.** *If  $\pi : G \rightarrow H$  is a homomorphism of additive groups and  $X, Y$  are  $G$ -valued random variables then*

$$d[X; Y] \geq d[\pi(X); \pi(Y)].$$

*Proof.* By Proposition 5.1 and the nonnegativity of conditional Ruzsa distance (from Lemma 3.15) we have

$$d[X; Y] \geq d[\pi(X); \pi(Y)] + d[X \mid \pi(X); Y \mid \pi(Y)].$$

The inequality follows from  $d[X \mid \pi(X); Y \mid \pi(Y)] \geq 0$  (Lemma 3.15).  $\square$

**Corollary 5.3** (Specific fibring identity). *Let  $Y_1, Y_2, Y_3$  and  $Y_4$  be independent  $G$ -valued random variables. Then*

$$\begin{aligned} & d[Y_1 + Y_3; Y_2 + Y_4] + d[Y_1 \mid Y_1 + Y_3; Y_2 \mid Y_2 + Y_4] \\ & + \mathbb{I}[Y_1 + Y_2 : Y_2 + Y_4 \mid Y_1 + Y_2 + Y_3 + Y_4] = d[Y_1; Y_2] + d[Y_3; Y_4]. \end{aligned}$$

*Proof.* We apply Proposition 5.1 with  $H := G \times G$ ,  $H' := G$ ,  $\pi$  the addition homomorphism  $\pi(x, y) := x + y$ , and with the random variables  $Z_1 := (Y_1, Y_3)$  and  $Z_2 := (Y_2, Y_4)$ . Then by independence (Corollary 2.24)

$$d[Z_1; Z_2] = d[Y_1; Y_2] + d[Y_3; Y_4]$$

while by definition

$$d[\pi(Z_1); \pi(Z_2)] = d[Y_1 + Y_3; Y_2 + Y_4].$$

Furthermore,

$$d[Z_1 \mid \pi(Z_1); Z_2 \mid \pi(Z_2)] = d[Y_1 \mid Y_1 + Y_3; Y_2 \mid Y_2 + Y_4],$$

since  $Z_1 = (Y_1, Y_3)$  and  $Y_1$  are linked by an invertible affine transformation once  $\pi(Z_1) = Y_1 + Y_3$  is fixed, and similarly for  $Z_2$  and  $Y_2$ . (This has to do with Lemma 2.12) Finally, we have

$$\begin{aligned} & \mathbb{I}[Z_1 + Z_2 : (\pi(Z_1), \pi(Z_2)) \mid \pi(Z_1) + \pi(Z_2)] \\ & = \mathbb{I}[(Y_1 + Y_2, Y_3 + Y_4) : (Y_1 + Y_3, Y_2 + Y_4) \mid Y_1 + Y_2 + Y_3 + Y_4] \\ & = \mathbb{I}[Y_1 + Y_2 : Y_2 + Y_4 \mid Y_1 + Y_2 + Y_3 + Y_4] \end{aligned}$$

where in the last line we used the fact that  $(Y_1 + Y_2, Y_1 + Y_2 + Y_3 + Y_4)$  uniquely determine  $Y_3 + Y_4$  and similarly  $(Y_2 + Y_4, Y_1 + Y_2 + Y_3 + Y_4)$  uniquely determine  $Y_1 + Y_3$ . (This requires another helper lemma about entropy.)  $\square$

# Chapter 6

## Entropy version of PFR

**Definition 6.1.**  $\eta := 1/9$ .

Throughout this chapter,  $G = \mathbb{F}_2^n$ , and  $X_1^0, X_2^0$  are  $G$ -valued random variables.

**Definition 6.2** ( $\tau$  functional). *If  $X_1, X_2$  are two  $G$ -valued random variables, then*

$$\tau[X_1; X_2] := d[X_1; X_2] + \eta d[X_1^0; X_1] + \eta d[X_2^0; X_2].$$

**Lemma 6.3** ( $\tau$  depends only on distribution). *If  $X_1', X_2'$  are copies of  $X_1, X_2$ , then  $\tau[X_1'; X_2'] = \tau[X_1; X_2]$ .*

*Proof.* Immediate from Lemma 3.6. □

**Definition 6.4** ( $\tau$ -minimizer). *A pair of  $G$ -valued random variables  $X_1, X_2$  are said to be a  $\tau$ -minimizer if one has*

$$\tau[X_1; X_2] \leq \tau[X_1'; X_2']$$

*for all  $G$ -valued random variables  $X_1', X_2'$ .*

**Proposition 6.5** ( $\tau$  has minimum). *A pair  $X_1, X_2$  of  $\tau$ -minimizers exist.*

*Proof.* By Lemma 6.3,  $\tau$  only depends on the probability distributions of  $X_1, X_2$ . This ranges over a compact space, and  $\tau$  is continuous. So  $\tau$  has a minimum. □

### 6.1 Basic facts about minimizers

In this section we assume that  $X_1, X_2$  are  $\tau$ -minimizers. We also write  $k := d[X_1; X_2]$ .

**Lemma 6.6** (Distance lower bound). *For any  $G$ -valued random variables  $X_1', X_2'$ , one has*

$$d[X_1'; X_2'] \geq k - \eta(d[X_1^0; X_1'] - d[X_1^0; X_1]) - \eta(d[X_2^0; X_2'] - d[X_2^0; X_2]).$$

*Proof.* Immediate from Definition 6.2 and Proposition 6.5. □

**Lemma 6.7** (Conditional distance lower bound). *For any  $G$ -valued random variables  $X_1', X_2'$  and random variables  $Z, W$ , one has*

$$d[X_1'|Z; X_2'|W] \geq k - \eta(d[X_1^0; X_1'|Z] - d[X_1^0; X_1]) - \eta(d[X_2^0; X_2'|W] - d[X_2^0; X_2]).$$

*Proof.* Apply Lemma 6.6 to conditioned random variables and then average. □

## 6.2 First estimate

We continue the assumptions from the preceding section.

Let  $X_1, X_2, \tilde{X}_1, \tilde{X}_2$  be independent random variables, with  $X_1, \tilde{X}_1$  copies of  $X_1$  and  $X_2, \tilde{X}_2$  copies of  $X_2$ . (This is possible thanks to Lemma 3.7.)

We also define the quantity

$$I_1 := I[X_1 + X_2 : \tilde{X}_1 + X_2 | X_1 + X_2 + \tilde{X}_1 + \tilde{X}_2].$$

**Lemma 6.8** (Fibring identity for first estimate). *We have*

$$\begin{aligned} & d[X_1 + \tilde{X}_2; X_2 + \tilde{X}_1] + d[X_1 | X_1 + \tilde{X}_2; X_2 | X_2 + \tilde{X}_1] \\ & + \mathbb{I}[X_1 + X_2 : \tilde{X}_1 + X_2 | X_1 + X_2 + \tilde{X}_1 + \tilde{X}_2] = 2k. \end{aligned}$$

*Proof.* Immediate from Corollary 5.3. □

**Lemma 6.9** (Lower bound on distances). *We have*

$$\begin{aligned} d[X_1 + \tilde{X}_2; X_2 + \tilde{X}_1] & \geq k - \eta(d[X_1^0; X_1 + \tilde{X}_2] - d[X_1^0; X_1]) \\ & \quad - \eta(d[X_2^0; X_2 + \tilde{X}_1] - d[X_2^0; X_2]) \end{aligned}$$

*Proof.* Immediate from Lemma 6.6. □

**Lemma 6.10** (Lower bound on conditional distances). *We have*

$$\begin{aligned} & d[X_1 | X_1 + \tilde{X}_2; X_2 | X_2 + \tilde{X}_1] \\ & \geq k - \eta(d[X_1^0; X_1 | X_1 + \tilde{X}_2] - d[X_1^0; X_1]) \\ & \quad - \eta(d[X_2^0; X_2 | X_2 + \tilde{X}_1] - d[X_2^0; X_2]). \end{aligned}$$

*Proof.* Immediate from Lemma 6.7. □

**Lemma 6.11** (Upper bound on distance differences). *We have*

$$\begin{aligned} & d[X_1^0; X_1 + \tilde{X}_2] - d[X_1^0; X_1] \leq \frac{1}{2}k + \frac{1}{4}\mathbb{H}[X_2] - \frac{1}{4}\mathbb{H}[X_1] \\ & d[X_2^0; X_2 + \tilde{X}_1] - d[X_2^0; X_2] \leq \frac{1}{2}k + \frac{1}{4}\mathbb{H}[X_1] - \frac{1}{4}\mathbb{H}[X_2], \\ & d[X_1^0; X_1 | X_1 + \tilde{X}_2] - d[X_1^0; X_1] \leq \frac{1}{2}k + \frac{1}{4}\mathbb{H}[X_1] - \frac{1}{4}\mathbb{H}[X_2] \\ & d[X_2^0; X_2 | X_2 + \tilde{X}_1] - d[X_2^0; X_2] \leq \frac{1}{2}k + \frac{1}{4}\mathbb{H}[X_2] - \frac{1}{4}\mathbb{H}[X_1]. \end{aligned}$$

*Proof.* Immediate from Lemma 3.25 (and recalling that  $k$  is defined to be  $d[X_1; X_2]$ ). □

**Lemma 6.12** (First estimate). *We have  $I_1 \leq 2\eta k$ .*

*Proof.* Take a suitable linear combination of Lemma 6.8, Lemma 6.9, Lemma 6.10, and Lemma 6.11. □

One can also extract the following useful inequality from the proof of the above lemma.

**Lemma 6.13** (Entropy bound on quadruple sum). *With the same notation, we have*

$$\mathbb{H}[X_1 + X_2 + \tilde{X}_1 + \tilde{X}_2] \leq \frac{1}{2}\mathbb{H}[X_1] + \frac{1}{2}\mathbb{H}[X_2] + (2 + \eta)k - I_1. \quad (6.1)$$

*Proof.* Subtracting Lemma 6.10 from Lemma 6.8, and combining the resulting inequality with Lemma 6.11 gives the bound

$$d[X_1 + \tilde{X}_2; X_2 + \tilde{X}_1] \leq (1 + \eta)k - I_1,$$

and the claim follows from Lemma 3.11 and the definition of  $k$ . □

### 6.3 Second estimate

We continue the assumptions from the preceding section. We introduce the quantity

$$I_2 := \mathbb{I}[X_1 + X_2 : X_1 + \tilde{X}_1 | X_1 + X_2 + \tilde{X}_1 + \tilde{X}_2].$$

**Lemma 6.14** (Distance between sums). *We have*

$$d[X_1 + \tilde{X}_1; X_2 + \tilde{X}_2] \geq k - \frac{\eta}{2}(d[X_1; X_1] + d[X_2; X_2]).$$

*Proof.* From Lemma 6.6 one has

$$\begin{aligned} d[X_1 + \tilde{X}_1; X_2 + \tilde{X}_2] &\geq k - \eta(d[X_1^0; X_1] - d[X_1^0; X_1 + \tilde{X}_1]) \\ &\quad - \eta(d[X_2^0; X_2] - d[X_2^0; X_2 + \tilde{X}_2]). \end{aligned}$$

Now Lemma 3.25 gives

$$d[X_1^0; X_1 + \tilde{X}_1] - d[X_1^0; X_1] \leq \frac{1}{2}d[X_1; X_1]$$

and

$$d[X_2^0; X_2 + \tilde{X}_2] - d[X_2^0; X_2] \leq \frac{1}{2}d[X_2; X_2],$$

and the claim follows.  $\square$

**Lemma 6.15.** *We have*

$$d[X_1; X_1] + d[X_2; X_2] \leq 2k + \frac{2(2\eta k - I_1)}{1 - \eta}.$$

*Proof.* We may use Lemma 3.11 to expand

$$\begin{aligned} &d[X_1 + \tilde{X}_1; X_2 + \tilde{X}_2] \\ &= \mathbb{H}[X_1 + \tilde{X}_1 + X_2 + \tilde{X}_2] - \frac{1}{2}\mathbb{H}[X_1 + \tilde{X}_1] - \frac{1}{2}\mathbb{H}[X_2 + \tilde{X}_2] \\ &= \mathbb{H}[X_1 + \tilde{X}_1 + X_2 + \tilde{X}_2] - \frac{1}{2}\mathbb{H}[X_1] - \frac{1}{2}\mathbb{H}[X_2] \\ &\quad - \frac{1}{2}(d[X_1; X_1] + d[X_2; X_2]), \end{aligned}$$

and hence by Lemma 6.13

$$d[X_1 + \tilde{X}_1; X_2 + \tilde{X}_2] \leq (2 + \eta)k - \frac{1}{2}(d[X_1; X_1] + d[X_2; X_2]) - I_1.$$

Combining this bound with Lemma 6.14 we obtain the result.  $\square$

**Lemma 6.16** (Second estimate). *We have*

$$I_2 \leq 2\eta k + \frac{2\eta(2\eta k - I_1)}{1 - \eta}.$$

*Proof.* We apply Corollary 5.3, but now with the choice

$$(Y_1, Y_2, Y_3, Y_4) := (X_2, X_1, \tilde{X}_2, \tilde{X}_1).$$

Now Corollary 5.3 can be rewritten as

$$d[X_1 + \tilde{X}_1; X_2 + \tilde{X}_2] + d[X_1|X_1 + \tilde{X}_1; X_2|X_2 + \tilde{X}_2] \\ + \mathbb{I}[X_1 + X_2 : X_1 + \tilde{X}_1 | X_1 + X_2 + \tilde{X}_1 + \tilde{X}_2] = 2k,$$

recalling once again that  $k := d[X_1; X_2]$ . From Lemma 6.7 one has

$$d[X_1|X_1 + \tilde{X}_1; X_2|X_2 + \tilde{X}_2] \geq k - \eta(d[X_1^0; X_1] - d[X_1^0; X_1|X_1 + \tilde{X}_1]) \\ - \eta(d[X_2^0; X_2] - d[X_2^0; X_2|X_2 + \tilde{X}_2]).$$

while from Lemma 3.25 we have

$$d[X_1^0; X_1|X_1 + \tilde{X}_1] - d[X_1^0; X_1] \leq \frac{1}{2}d[X_1; X_1],$$

and

$$d[X_2^0; X_2|X_2 + \tilde{X}_2] - d[X_2^0; X_2] \leq \frac{1}{2}d[X_2; X_2].$$

Combining all these inequalities with Lemma 6.14, we have

$$\mathbb{I}[X_1 + X_2 : X_1 + \tilde{X}_1 | X_1 + X_2 + \tilde{X}_1 + \tilde{X}_2] \leq \eta(d[X_1; X_1] + d[X_2; X_2]). \quad (6.2)$$

Together with Lemma 6.15, this gives the conclusion.  $\square$

## 6.4 Endgame

Let  $X_1, X_2, \tilde{X}_1, \tilde{X}_2$  be as before, and introduce the random variables

$$U := X_1 + X_2, \quad V := \tilde{X}_1 + X_2, \quad W := X_1 + \tilde{X}_1$$

and

$$S := X_1 + X_2 + \tilde{X}_1 + \tilde{X}_2.$$

**Lemma 6.17** (Symmetry identity). *We have*

$$I(U : W | S) = I(V : W | S).$$

*Proof.* This should follow from Lemma 3.6, Lemma 2.26, and Lemma 2.13.  $\square$

**Lemma 6.18** (Bound on conditional mutual informations). *We have*

$$I(U : V | S) + I(V : W | S) + I(W : U | S) \leq 6\eta k - \frac{1 - 5\eta}{1 - \eta}(2\eta k - I_1).$$

*Proof.* From the definitions of  $I_1, I_2$  and Lemma 6.17, we see that

$$I_1 = I(U : V | S), \quad I_2 = I(W : U | S), \quad I_2 = I(V : W | S).$$

Applying Lemma 6.12 and Lemma 6.16 we have the inequalities

$$I_2 \leq 2\eta k + \frac{2\eta(2\eta k - I_1)}{1 - \eta}.$$

We conclude that

$$I_1 + I_2 + I_2 \leq I_1 + 4\eta k + \frac{4\eta(2\eta k - I_1)}{1 - \eta}$$

and the claim follows from some calculation.  $\square$

**Lemma 6.19** (Bound on distance increments). *We have*

$$\begin{aligned} \sum_{i=1}^2 \sum_{A \in \{U, V, W\}} (d[X_i^0; A|S] - d[X_i^0; X_i]) \\ \leq (6 - 3\eta)k + 3(2\eta k - I_1). \end{aligned}$$

*Proof.* By Lemma 3.26 (taking  $X = X_1^0$ ,  $Y = X_1$ ,  $Z = X_2$  and  $Z' = \tilde{X}_1 + \tilde{X}_2$ , so that  $Y + Z = U$  and  $Y + Z + Z' = S$ ) we have, noting that  $\mathbb{H}[Y + Z] = \mathbb{H}[Z']$ ,

$$d[X_1^0; U|S] - d[X_1^0; X_1] \leq \frac{1}{2}(\mathbb{H}[S] - \mathbb{H}[X_1]).$$

Further applications of Lemma 3.26 give

$$\begin{aligned} d[X_2^0; U|S] - d[X_2^0; X_2] &\leq \frac{1}{2}(\mathbb{H}[S] - \mathbb{H}[X_2]) \\ d[X_1^0; V|S] - d[X_1^0; X_1] &\leq \frac{1}{2}(\mathbb{H}[S] - \mathbb{H}[X_1]) \\ d[X_2^0; V|S] - d[X_2^0; X_2] &\leq \frac{1}{2}(\mathbb{H}[S] - \mathbb{H}[X_2]) \end{aligned}$$

and

$$d[X_1^0; W|S] - d[X_1^0; X_1] \leq \frac{1}{2}(\mathbb{H}[S] + \mathbb{H}[W] - \mathbb{H}[X_1] - \mathbb{H}[W']),$$

where  $W' := X_2 + \tilde{X}_2$ . To treat  $d[X_2^0; W|S]$ , first note that this equals  $d[X_2^0; W'|S]$ , since for a fixed choice  $s$  of  $S$  we have  $W' = W + s$  (here we need some helper lemma about Ruzsa distance). Now we may apply Lemma 3.26 to obtain

$$d[X_2^0; W'|S] - d[X_2^0; X_2] \leq \frac{1}{2}(\mathbb{H}[S] + \mathbb{H}[W'] - \mathbb{H}[X_2] - \mathbb{H}[W]).$$

Summing these six estimates and using Lemma 6.13, we conclude that

$$\begin{aligned} \sum_{i=1}^2 \sum_{A \in \{U, V, W\}} (d[X_i^0; A|S] - d[X_i^0; X_i]) \\ \leq 3\mathbb{H}[S] - \frac{3}{2}\mathbb{H}[X_1] - \frac{3}{2}\mathbb{H}[X_2] \\ \leq (6 - 3\eta)k + 3(2\eta k - I_1) \end{aligned}$$

as required. □

**Lemma 6.20** (Key identity). *We have  $U + V + W = 0$ .*

*Proof.* Obvious because we are in characteristic two. □

For the next two lemmas, let  $(T_1, T_2, T_3)$  be a  $G^3$ -valued random variable such that  $T_1 + T_2 + T_3 = 0$  holds identically. Set

$$\delta := \sum_{1 \leq i < j \leq 3} \mathbb{H}[T_i; T_j]. \tag{6.3}$$

**Lemma 6.21** (Constructing good variables, I). *One has*

$$\begin{aligned} k \leq \delta + \eta(d[X_1^0; T_1] - d[X_1^0; X_1]) + \eta(d[X_2^0; T_2] - d[X_2^0; X_2]) \\ + \frac{1}{2}\eta\mathbb{H}[T_1; T_3] + \frac{1}{2}\eta\mathbb{H}[T_2; T_3]. \end{aligned}$$

(Note: in the paper, this lemma was phrased in a more intuitive formulation that is basically the contrapositive of the one here. Similarly for the next two lemmas.)

*Proof.* We apply Lemma 3.23 with  $(A, B) = (T_1, T_2)$  there. Since  $T_1 + T_2 = T_3$ , the conclusion is that

$$\begin{aligned} \sum_{t_3} \mathbb{P}[T_3 = t_3] d[(T_1|T_3 = t_3); (T_2|T_3 = t_3)] \\ \leq 3\mathbb{H}[T_1 : T_2] + 2\mathbb{H}[T_3] - \mathbb{H}[T_1] - \mathbb{H}[T_2]. \end{aligned} \quad (6.4)$$

The right-hand side in (6.4) can be rearranged as

$$\begin{aligned} 2(\mathbb{H}[T_1] + \mathbb{H}[T_2] + \mathbb{H}[T_3]) - 3\mathbb{H}[T_1, T_2] \\ = 2(\mathbb{H}[T_1] + \mathbb{H}[T_2] + \mathbb{H}[T_3]) - \mathbb{H}[T_1, T_2] - \mathbb{H}[T_2, T_3] - \mathbb{H}[T_1, T_3] = \delta, \end{aligned}$$

using the fact (from Lemma 2.2) that all three terms  $\mathbb{H}[T_i, T_j]$  are equal to  $\mathbb{H}[T_1, T_2, T_3]$  and hence to each other. We also have

$$\begin{aligned} \sum_{t_3} P[T_3 = t_3] (d[X_1^0; (T_1|T_3 = t_3)] - d[X_1^0; X_1]) \\ = d[X_1^0; T_1|T_3] - d[X_1^0; X_1] \leq d[X_1^0; T_1] - d[X_1^0; X_1] + \frac{1}{2}\mathbb{H}[T_1 : T_3] \end{aligned}$$

by Lemma 3.24, and similarly

$$\begin{aligned} \sum_{t_3} \mathbb{P}[T_3 = t_3] (d[X_2^0; (T_2|T_3 = t_3)] - d[X_2^0; X_2]) \\ \leq d[X_2^0; T_2] - d[X_2^0; X_2] + \frac{1}{2}\mathbb{H}[T_2 : T_3]. \end{aligned}$$

Putting the above observations together, we have

$$\begin{aligned} \sum_{t_3} \mathbb{P}[T_3 = t_3] \psi[(T_1|T_3 = t_3); (T_2|T_3 = t_3)] \leq \delta + \eta(d[X_1^0; T_1] - d[X_1^0; X_1]) \\ + \eta(d[X_2^0; T_2] - d[X_2^0; X_2]) + \frac{1}{2}\eta\mathbb{H}[T_1 : T_3] + \frac{1}{2}\eta\mathbb{H}[T_2 : T_3] \end{aligned}$$

where we introduce the notation

$$\psi[Y_1; Y_2] := d[Y_1; Y_2] + \eta(d[X_1^0; Y_1] - d[X_1^0; X_1]) + \eta(d[X_2^0; Y_2] - d[X_2^0; X_2]).$$

On the other hand, from Lemma 6.6 we have  $k \leq \psi[Y_1; Y_2]$ , and the claim follows.  $\square$

**Lemma 6.22** (Constructing good variables, II). *One has*

$$k \leq \delta + \frac{\eta}{3} \left( \delta + \sum_{i=1}^2 \sum_{j=1}^3 (d[X_i^0; T_j] - d[X_i^0; X_i]) \right).$$

*Proof.* Average Lemma 6.21 over all six permutations of  $T_1, T_2, T_3$ .  $\square$

**Theorem 6.23** ( $\tau$ -decrement). *Let  $X_1, X_2$  be tau-minimizers. Then  $d[X_1; X_2] = 0$ .*

*Proof.* Set  $k := d[X_1; X_2]$ . Applying Lemma 6.22 with any random variables  $(T_1, T_2, T_3)$  such that  $T_1 + T_2 + T_3 = 0$  holds identically, we deduce that

$$k \leq \delta + \frac{\eta}{3} \left( \delta + \sum_{i=1}^2 \sum_{j=1}^3 (d[X_1^0; T_j] - d[X_i^0; X_i]) \right).$$

Note that  $\delta$  is still defined by (6.3) and thus depends on  $T_1, T_2, T_3$ . In particular we may apply this for

$$T_1 = (U|S = s), \quad T_2 = (V|S = s), \quad T_3 = (W|S = s)$$

for  $s$  in the range of  $S$  (which is a valid choice by Lemma 6.20) and then average over  $s$  with weights  $p_S(s)$ , to obtain

$$k \leq \tilde{\delta} + \frac{\eta}{3} \left( \tilde{\delta} + \sum_{i=1}^2 \sum_{A \in \{U, V, W\}} (d[X_i^0; A|S] - d[X_i^0; X_i]) \right),$$

where

$$\tilde{\delta} := \mathbb{I}[U : V|S] + \mathbb{I}[V : W|S] + \mathbb{I}[W : U|S].$$

Putting this together with Lemma 6.18 and Lemma 6.19, we conclude that

$$\begin{aligned} k &\leq \left(1 + \frac{\eta}{3}\right) \left(6\eta k - \frac{1-5\eta}{1-\eta}(2\eta k - I_1)\right) + \frac{\eta}{3} \left((6-3\eta)k + 3(2\eta k - I_1)\right) \\ &= (8\eta + \eta^2)k - \left(\frac{1-5\eta}{1-\eta} \left(1 + \frac{\eta}{3}\right) - \eta\right) (2\eta k - I_1) \\ &\leq (8\eta + \eta^2)k \end{aligned}$$

since the quantity  $2\eta k - I_1$  is non-negative (by Lemma 6.12), and its coefficient in the above expression is non-positive provided that  $\eta(2\eta + 17) \leq 3$ , which is certainly the case with Definition 6.1. Moreover, from Definition 6.1 we have  $8\eta + \eta^2 < 1$ . It follows that  $k = 0$ , as desired.  $\square$

## 6.5 Conclusion

**Theorem 6.24** (Entropy version of PFR). *Let  $G = \mathbb{F}_2^n$ , and suppose that  $X_1^0, X_2^0$  are  $G$ -valued random variables. Then there is some subgroup  $H \leq G$  such that*

$$d[X_1^0; U_H] + d[X_2^0; U_H] \leq 11d[X_1^0; X_2^0],$$

where  $U_H$  is uniformly distributed on  $H$ . Furthermore, both  $d[X_1^0; U_H]$  and  $d[X_2^0; U_H]$  are at most  $6d[X_1^0; X_2^0]$ .

*Proof.* Let  $X_1, X_2$  be the  $\tau$ -minimizer from Proposition 6.5. From Theorem 6.23,  $d[X_1; X_2] = 0$ . From Corollary 4.6,  $d[X_1; U_H] = d[X_2; U_H] = 0$ . Also from  $\tau$ -minimization we have  $\tau[X_1; X_2] \leq \tau[X_2^0; X_1^0]$ . Using this and the Ruzsa triangle inequality we can conclude.  $\square$

Note: a ‘stretch goal’ for this project would be to obtain a ‘decidable’ analogue of this result (see the remark at the end of Section 2 for some related discussion).

# Chapter 7

## Proof of PFR

**Lemma 7.1** (Ruzsa covering lemma). *If  $A, B$  are finite non-empty subsets of a group  $G$ , then  $A$  can be covered by at most  $|A + B|/|B|$  translates of  $B - B$ .*

*Proof.* Cover  $A$  greedily by disjoint translates of  $B$ .  $\square$

**Lemma 7.2.** *If  $A \subset \mathbf{F}_2^n$  is non-empty and  $|A + A| \leq K|A|$ , then  $A$  can be covered by at most  $K^{13/2}|A|^{1/2}/|H|^{1/2}$  translates of a subspace  $H$  of  $\mathbf{F}_2^n$  with*

$$|H|/|A| \in [K^{-11}, K^{11}]. \quad (7.1)$$

*Proof.* Let  $U_A$  be the uniform distribution on  $A$  (which exists by Lemma 2.5), thus  $\mathbb{H}[U_A] = \log |A|$  by Lemma 2.7. By Lemma 2.3 and the fact that  $U_A + U_A$  is supported on  $A + A$ ,  $\mathbb{H}[U_A + U_A] \leq \log |A + A|$ . By Definition 3.8, the doubling condition  $|A + A| \leq K|A|$  therefore gives

$$d[U_A; U_A] \leq \log K.$$

By Theorem 6.24, we may thus find a subspace  $H$  of  $\mathbf{F}_2^n$  such that

$$d[U_A; U_H] \leq \frac{1}{2}C' \log K \quad (7.2)$$

with  $C' = 11$ . By Lemma 3.13 we conclude that

$$|\log |H| - \log |A|| \leq C' \log K,$$

proving (7.1). From Definition 3.8, (7.2) is equivalent to

$$\mathbb{H}[U_A - U_H] \leq \log(|A|^{1/2}|H|^{1/2}) + \frac{1}{2}C' \log K.$$

By Lemma 2.8 we conclude the existence of a point  $x_0 \in \mathbf{F}_p^n$  such that

$$p_{U_A - U_H}(x_0) \geq |A|^{-1/2}|H|^{-1/2}K^{-C'/2},$$

or equivalently

$$|A \cap (H + x_0)| \geq K^{-C'/2}|A|^{1/2}|H|^{1/2}.$$

Applying Lemma 7.1, we may thus cover  $A$  by at most

$$\frac{|A + (A \cap (H + x_0))|}{|A \cap (H + x_0)|} \leq \frac{K|A|}{K^{-C'/2}|A|^{1/2}|H|^{1/2}} = K^{C'/2+1} \frac{|A|^{1/2}}{|H|^{1/2}}$$

translates of

$$(A \cap (H + x_0)) - (A \cap (H + x_0)) \subseteq H.$$

This proves the claim.  $\square$

**Theorem 7.3** (PFR). *If  $A \subset \mathbf{F}_2^n$  is non-empty and  $|A + A| \leq K|A|$ , then  $A$  can be covered by most  $2K^{12}$  translates of a subspace  $H$  of  $\mathbf{F}_2^n$  with  $|H| \leq |A|$ .*

*Proof.* Let  $H$  be given by Lemma 7.2. If  $|H| \leq |A|$  then we are already done thanks to (7.1). If  $|H| > |A|$  then we can cover  $H$  by at most  $2|H|/|A|$  translates of a subspace  $H'$  of  $H$  with  $|H'| \leq |A|$ . We can thus cover  $A$  by at most

$$2K^{13/2} \frac{|H|^{1/2}}{|A|^{1/2}}$$

translates of  $H'$ , and the claim again follows from (7.1).  $\square$

**Corollary 7.4** (PFR in infinite groups). *If  $G$  is an abelian 2-torsion group,  $A \subset G$  is non-empty finite, and  $|A + A| \leq K|A|$ , then  $A$  can be covered by most  $2K^{12}$  translates of a finite group  $H$  of  $G$  with  $|H| \leq |A|$ .*

*Proof.* Apply Theorem 7.3 to the group generated by  $A$ , which is isomorphic to  $\mathbf{F}_2^n$  for some  $n$ .  $\square$

# Chapter 8

## Improving the exponents

The arguments here are due to Jyun-Jie Liao.

**Definition 8.1** (New definition of  $\eta$ ).  $\eta$  is a real parameter with  $\eta > 0$ .

Previously in Definition 6.1 we had set  $\eta = 1/9$ . To implement this chapter, one should refactor the previous arguments so that  $\eta$  is now free to be a positive number, though the specific hypothesis  $\eta = 1/9$  would now need to be added to Theorem 6.23.

Let  $X_1^0, X_2^0$  be  $G$ -valued random variables, and let  $X_1, X_2$  be  $\tau$ -minimizers as defined in Definition 6.4.

For the next two lemmas, let  $(T_1, T_2, T_3)$  be a  $G^3$ -valued random variable such that  $T_1 + T_2 + T_3 = 0$  holds identically. Let  $\delta$  be the quantity in (6.3).

We have the following variant of Lemma 6.21:

**Lemma 8.2** (Constructing good variables, I). *One has*

$$k \leq \delta + \eta(d[X_1^0; T_1|T_3] - d[X_1^0; X_1]) + \eta(d[X_2^0; T_2|T_3] - d[X_2^0; X_2]).$$

*Proof.* We apply Lemma 3.23 with  $(A, B) = (T_1, T_2)$  there. Since  $T_1 + T_2 = T_3$ , the conclusion is that

$$\begin{aligned} \sum_{t_3} \mathbb{P}[T_3 = t_3] d[(T_1|T_3 = t_3); (T_2|T_3 = t_3)] \\ \leq 3\mathbb{H}[T_1 : T_2] + 2\mathbb{H}[T_3] - \mathbb{H}[T_1] - \mathbb{H}[T_2]. \end{aligned} \quad (8.1)$$

The right-hand side in (8.1) can be rearranged as

$$\begin{aligned} 2(\mathbb{H}[T_1] + \mathbb{H}[T_2] + \mathbb{H}[T_3]) - 3\mathbb{H}[T_1, T_2] \\ = 2(\mathbb{H}[T_1] + \mathbb{H}[T_2] + \mathbb{H}[T_3]) - \mathbb{H}[T_1, T_2] - \mathbb{H}[T_2, T_3] - \mathbb{H}[T_1, T_3] = \delta, \end{aligned}$$

using the fact (from Lemma 2.2) that all three terms  $\mathbb{H}[T_i, T_j]$  are equal to  $\mathbb{H}[T_1, T_2, T_3]$  and hence to each other. We also have

$$\begin{aligned} \sum_{t_3} P[T_3 = t_3] (d[X_1^0; (T_1|T_3 = t_3)] - d[X_1^0; X_1]) \\ = d[X_1^0; T_1|T_3] - d[X_1^0; X_1] \end{aligned}$$

and similarly

$$\begin{aligned} \sum_{t_3} \mathbb{P}[T_3 = t_3] (d[X_2^0; (T_2|T_3 = t_3)] - d[X_2^0; X_2]) \\ \leq d[X_2^0; T_2|T_3] - d[X_2^0; X_2]. \end{aligned}$$

Putting the above observations together, we have

$$\begin{aligned} \sum_{t_3} \mathbb{P}[T_3 = t_3] \psi[(T_1|T_3 = t_3); (T_2|T_3 = t_3)] \leq \delta + \eta(d[X_1^0; T_1|T_3] - d[X_1^0; X_1]) \\ + \eta(d[X_2^0; T_2|T_3] - d[X_2^0; X_2]) \end{aligned}$$

where we introduce the notation

$$\psi[Y_1; Y_2] := d[Y_1; Y_2] + \eta(d[X_1^0; Y_1] - d[X_1^0; X_1]) + \eta(d[X_2^0; Y_2] - d[X_2^0; X_2]).$$

On the other hand, from Lemma 6.6 we have  $k \leq \psi[Y_1; Y_2]$ , and the claim follows.  $\square$

(One could in fact refactor Lemma 6.21 to follow from Lemma 8.2 and Lemma 3.24).

**Lemma 8.3** (Constructing good variables, II'). *One has*

$$k \leq \delta + \frac{\eta}{6} \sum_{i=1}^2 \sum_{1 \leq j, l \leq 3; j \neq l} (d[X_i^0; T_j|T_l] - d[X_i^0; X_i])$$

*Proof.* Average Lemma 8.2 over all six permutations of  $T_1, T_2, T_3$ .  $\square$

Now let  $X_1, X_2, \tilde{X}_1, \tilde{X}_2$  be independent copies of  $X_1, X_2, X_1, X_2$ , and set

$$U := X_1 + X_2, \quad V := \tilde{X}_1 + X_2, \quad W := X_1 + \tilde{X}_1$$

and

$$S := X_1 + X_2 + \tilde{X}_1 + \tilde{X}_2$$

and introduce the quantities

$$k = d[X_1; X_2]$$

and

$$I_1 = I(U : V | S).$$

**Lemma 8.4** (Constructing good variables, III'). *One has*

$$k \leq I(U : V | S) + I(V : W | S) + I(W : U | S) + \frac{\eta}{6} \sum_{i=1}^2 \sum_{A, B \in \{U, V, W\}: A \neq B} (d[X_i^0; A|B, S] - d[X_i^0; X_i]).$$

*Proof.* For each  $s$  in the range of  $S$ , apply Lemma 8.3 with  $T_1, T_2, T_3$  equal to  $(U|S = s)$ ,  $(V|S = s)$ ,  $(W|S = s)$  respectively (which works thanks to Lemma 6.20), multiply by  $\mathbb{P}[S = s]$ , and sum in  $s$  to conclude.  $\square$

To control the expressions in the right-hand side of this lemma we need a general entropy inequality.

**Lemma 8.5** (General inequality). *Let  $X_1, X_2, X_3, X_4$  be independent  $G$ -valued random variables, and let  $Y$  be another  $G$ -valued random variable. Set  $S := X_1 + X_2 + X_3 + X_4$ . Then*

$$\begin{aligned}
& d[Y; X_1 + X_2 | X_1 + X_3, S] - d[Y; X_1] \\
& \leq \frac{1}{4}(d[X_1; X_2] + 2d[X_1; X_3] + d[X_2; X_4]) \\
& \quad + \frac{1}{4}(d[X_1 | X_1 + X_3; X_2 | X_2 + X_4] - d[X_3 | X_3 + X_4; X_1 | X_1 + X_2]) \\
& \quad + \frac{1}{8}(\mathbb{H}[X_1 + X_2] - \mathbb{H}[X_3 + X_4] + \mathbb{H}[X_2] - \mathbb{H}[X_3] \\
& \quad \quad + \mathbb{H}[X_2 | X_2 + X_4] - \mathbb{H}[X_1 | X_1 + X_3]).
\end{aligned}$$

*Proof.* On the one hand, by Lemma 3.24 and two applications of Lemma 3.25 we have

$$\begin{aligned}
& d[Y; X_1 + X_2 | X_1 + X_3, S] \\
& \leq d[Y; X_1 + X_2 | S] + \frac{1}{2}\mathbb{I}[X_1 + X_2 : X_1 + X_3 | S] \\
& \leq d[Y; X_1 + X_2] \\
& \quad + \frac{1}{2}(d[X_1 + X_2; X_3 + X_4] + \mathbb{I}[X_1 + X_2 : X_1 + X_3 | S]) \\
& \quad + \frac{1}{4}(\mathbb{H}[X_1 + X_2] - \mathbb{H}[X_3 + X_4]) \\
& \leq d[Y; X_1] \\
& \quad + \frac{1}{2}(d[X_1; X_2] + d[X_1 + X_2; X_3 + X_4] + \mathbb{I}[X_1 + X_2 : X_1 + X_3 | S]) \\
& \quad + \frac{1}{4}(\mathbb{H}[X_1 + X_2] - \mathbb{H}[X_3 + X_4] + \mathbb{H}[X_2] - \mathbb{H}[X_1]).
\end{aligned}$$

From Corollary 5.3 (with  $Y_1, Y_2, Y_3, Y_4$  set equal to  $X_3, X_1, X_4, X_2$  respectively) one has

$$\begin{aligned}
& d[X_3 + X_4; X_1 + X_2] + d[X_3 | X_3 + X_4; X_1 | X_1 + X_2] \\
& \quad + \mathbb{I}[X_3 + X_4 : X_1 + X_2 | S] = d[X_3; X_1] + d[X_4; X_2].
\end{aligned}$$

Rearranging the mutual information and Ruzsa distances slightly, we conclude that

$$\begin{aligned}
& d[Y; X_1 + X_2 | X_1 + X_3, S] \\
& \leq d[Y; X_1] \\
& \quad + \frac{1}{2}(d[X_1; X_2] + d[X_1; X_3] + d[X_2; X_4] - d[X_3 | X_3 + X_4; X_1 | X_1 + X_2]) \\
& \quad + \frac{1}{4}(\mathbb{H}[X_1 + X_2] - \mathbb{H}[X_3 + X_4] + \mathbb{H}[X_2] - \mathbb{H}[X_1]).
\end{aligned}$$

On the other hand,  $(X_1 + X_2 | X_1 + X_3, S)$  has an identical distribution to the independent sum of  $(X_1 | X_1 + X_3)$  and  $(X_2 | X_2 + X_4)$ . We may therefore apply Lemma 3.25 to conditioned variables  $(X_1 | X_1 + X_3 = s)$  and  $(X_2 | X_2 + X_4 = t)$  and average in  $s, t$  to obtain the alternative bound

$$\begin{aligned}
& d[Y; X_1 + X_2 | X_1 + X_3, S] \\
& \leq d[Y; X_1 | X_1 + X_3] + \frac{1}{2}d[X_1 | X_1 + X_3; X_2 | X_2 + X_4] \\
& \quad + \frac{1}{4}(\mathbb{H}[X_2 | X_2 + X_4] - \mathbb{H}[X_1 | X_1 + X_3]) \\
& \leq d[Y; X_1] \\
& \quad + \frac{1}{2}(d[X_1; X_3] + d[X_1 | X_1 + X_3; X_2 | X_2 + X_4]) \\
& \quad + \frac{1}{4}(\mathbb{H}[X_2 | X_2 + X_4] - \mathbb{H}[X_1 | X_1 + X_3] + \mathbb{H}[X_1] - \mathbb{H}[X_3]).
\end{aligned}$$

If one takes the arithmetic mean of these two bounds and simplifies using Corollary 5.3, one obtains the claim.  $\square$

Returning to our specific situation, we now have

**Lemma 8.6** (Bound on distance differences). *We have*

$$\begin{aligned} & \sum_{i=1}^2 \sum_{A, B \in \{U, V, W\}: A \neq B} d[X_i^0; A|B, S] - d[X_i^0; X_i] \\ & \leq 12k + \frac{4(2\eta k - I_1)}{1 - \eta}. \end{aligned}$$

*Proof.* If we apply Lemma 8.5 with  $X_1 := X_1$ ,  $Y := X_1^0$  and  $(X_2, X_3, X_4)$  equal to the 3! permutations of  $(X_2, \tilde{X}_1, \tilde{X}_2)$ , and sums (using the symmetry  $\mathbb{H}[X|X+Y] = \mathbb{H}[Y|X+Y]$ , which follows from Lemma 2.12), we can bound

$$\sum_{A, B \in \{U, V, W\}: A \neq B} d[X_1^0; A|B, S] - d[X_1^0; X_1]$$

by

$$\begin{aligned} & \frac{1}{4}(6d[X_1; X_2] + 6d[X_1; \tilde{X}_2]) \\ & + 6d[X_1; \tilde{X}_1] + 2d[\tilde{X}_1; \tilde{X}_2] + 2d[\tilde{X}_1; X_2] + 2d[X_2; \tilde{X}_2]) \\ & + \frac{1}{8}(2\mathbb{H}[X_1 + X_2] + 2\mathbb{H}[X_1 + \tilde{X}_1] + 2\mathbb{H}[X_1 + \tilde{X}_2] \\ & - 2\mathbb{H}[\tilde{X}_1 + X_2] - 2\mathbb{H}[X_2 + \tilde{X}_2] - 2\mathbb{H}[\tilde{X}_1 + \tilde{X}_2]) \\ & + \frac{1}{4}(\mathbb{H}[X_2|X_2 + \tilde{X}_2] + \mathbb{H}[\tilde{X}_1|\tilde{X}_1 + \tilde{X}_2] + \mathbb{H}[\tilde{X}_1|X_1 + \tilde{X}_2] \\ & - \mathbb{H}[X_1|X_1 + \tilde{X}_1] - \mathbb{H}[X_1|X_1 + X_2] - \mathbb{H}[X_1|X_1 + \tilde{X}_2]), \end{aligned}$$

which simplifies to

$$\begin{aligned} & \frac{1}{4}(16k + 6d[X_1; X_1] + 2d[X_2; X_2]) \\ & + \frac{1}{4}(H[X_1 + \tilde{X}_1] - H[X_2 + \tilde{X}_2] + d[X_2|X_2 + \tilde{X}_2] - d[X_1|X_1 + \tilde{X}_1]). \end{aligned}$$

A symmetric argument also bounds

$$\sum_{A, B \in \{U, V, W\}: A \neq B} d[X_2^0; A|B, S] - d[X_2^0; X_2]$$

by

$$\begin{aligned} & \frac{1}{4}(16k + 6d[X_2; X_2] + 2d[X_1; X_1]) \\ & + \frac{1}{4}(H[X_2 + \tilde{X}_2] - H[X_1 + \tilde{X}_1] + d[X_1|X_1 + \tilde{X}_1] - d[X_2|X_2 + \tilde{X}_2]). \end{aligned}$$

On the other hand, from Lemma 6.15 one has

$$d[X_1; X_1] + d[X_2; X_2] \leq 2k + \frac{2(2\eta k - I_1)}{1 - \eta}.$$

Summing the previous three estimates, we obtain the claim.  $\square$

**Theorem 8.7** (Improved  $\tau$ -decrement). *Suppose  $0 < \eta < 1/8$ . Let  $X_1, X_2$  be tau-minimizers. Then  $d[X_1; X_2] = 0$ .*

*Proof.* From Lemma 8.4, Lemma 8.6, and Lemma 6.18 one has

$$k \leq 8\eta k - \frac{(1 - 5\eta - \frac{4}{6}\eta)(2\eta k - I_1)}{(1 - \eta)}.$$

For any  $\eta < 1/8$ , we see from Lemma 6.12 that the expression  $\frac{(1 - 5\eta - \frac{4}{6}\eta)(2\eta k - I_1)}{(1 - \eta)}$  is nonnegative, and hence  $k = 0$  as required.  $\square$

**Theorem 8.8** (Limiting improved  $\tau$ -decrement). *For  $\eta = 1/8$ , there exist tau-minimizers  $X_1, X_2$  satisfying  $d[X_1; X_2] = 0$ .*

*Proof.* For each  $\eta < 1/8$ , consider minimizers  $X_1^\eta$  and  $X_2^\eta$  from Proposition 6.5. By Theorem 8.7, they satisfy  $d[X_1^\eta; X_2^\eta] = 0$ . By compactness of the space of probability measures on  $G$ , one may extract a converging subsequence of the distributions of  $X_1^\eta$  and  $X_2^\eta$  as  $\eta \rightarrow 1/8$ . By continuity of all the involved quantities, the limit is a pair of tau-minimizers for  $1/8$  satisfying additionally  $d[X_1; X_2] = 0$ .  $\square$

**Theorem 8.9** (Improved entropy version of PFR). *Let  $G = \mathbb{F}_2^n$ , and suppose that  $X_1^0, X_2^0$  are  $G$ -valued random variables. Then there is some subgroup  $H \leq G$  such that*

$$d[X_1^0; U_H] + d[X_2^0; U_H] \leq 10d[X_1^0; X_2^0],$$

where  $U_H$  is uniformly distributed on  $H$ . Furthermore, both  $d[X_1^0; U_H]$  and  $d[X_2^0; U_H]$  are at most  $6d[X_1^0; X_2^0]$ .

*Proof.* Let  $X_1, X_2$  be the good  $\tau$ -minimizer from Theorem 8.8. By construction,  $d[X_1; X_2] = 0$ . From Corollary 4.6,  $d[X_1; U_H] = d[X_2; U_H] = 0$ . Also from  $\tau$ -minimization we have  $\tau[X_1; X_2] \leq \tau[X_2^0; X_1^0]$ . Using this and the Ruzsa triangle inequality we can conclude.  $\square$

One can then replace Lemma 7.2 with

**Lemma 8.10.** *If  $A \subset \mathbf{F}_2^n$  is non-empty and  $|A + A| \leq K|A|$ , then  $A$  can be covered by at most  $K^6|A|^{1/2}/|H|^{1/2}$  translates of a subspace  $H$  of  $\mathbf{F}_2^n$  with*

$$|H|/|A| \in [K^{-10}, K^{10}].$$

*Proof.* By repeating the proof of Lemma 7.2 and using Theorem 8.9 one can obtain the claim with  $13/2$  replaced with  $6$  and  $11$  replaced by  $10$ .  $\square$

This implies the following improved version of Theorem 7.3:

**Theorem 8.11** (Improved PFR). *If  $A \subset \mathbf{F}_2^n$  is non-empty and  $|A + A| \leq K|A|$ , then  $A$  can be covered by at most  $2K^{11}$  translates of a subspace  $H$  of  $\mathbf{F}_2^n$  with  $|H| \leq |A|$ .*

*Proof.* By repeating the proof of Theorem 7.3 and using Lemma 8.10 one can obtain the claim with  $11$  replaced by  $10$ .  $\square$

Of course, by replacing Theorem 7.3 with Theorem 8.11 we may also improve constants in downstream theorems in a straightforward manner.

## Chapter 9

# Homomorphism version of PFR

In this section,  $G, G'$  are finite abelian 2-groups.

**Lemma 9.1** (Hahn-Banach type theorem). *Let  $H_0$  be a subgroup of  $G$ . Then every homomorphism  $\phi : H_0 \rightarrow G'$  can be extended to a homomorphism  $\tilde{\phi} : G \rightarrow G'$ .*

*Proof.* By induction it suffices to treat the case where  $H_0$  has index 2 in  $G$ , but then the extension can be constructed by hand.  $\square$

**Lemma 9.2** (Goursat type theorem). *Let  $H$  be a subgroup of  $G \times G'$ . Then there exists a subgroup  $H_0$  of  $G$ , a subgroup  $H_1$  of  $G'$ , and a homomorphism  $\phi : G \rightarrow G'$  such that*

$$H := \{(x, \phi(x) + y) : x \in H_0, y \in H_1\}.$$

*In particular,  $|H| = |H_0||H_1|$ .*

*Proof.* We can take  $H_0$  to be the projection of  $H$  to  $G$ , and  $H_1$  to be the slice  $H_1 := \{y : (0, y) \in H\}$ . One can construct  $\phi$  on  $H_0$  one generator at a time by the greedy algorithm, and then extend to  $G$  by Lemma 9.1. The cardinality bound is clear from direct counting.  $\square$

**Theorem 9.3** (Homomorphism form of PFR). *Let  $f : G \rightarrow G'$  be a function, and let  $S$  denote the set*

$$S := \{f(x + y) - f(x) - f(y) : x, y \in G\}.$$

*Then there exists a homomorphism  $\phi : G \rightarrow G'$  such that*

$$|\{f(x) - \phi(x) : x \in G\}| \leq |S|^{12}.$$

*Proof.* Consider the graph  $A \subset G \times G'$  defined by

$$A := \{(x, f(x)) : x \in G\}.$$

Clearly,  $|A| = |G|$ . By hypothesis, we have

$$A + A \subset \{(x, f(x) + s) : x \in G, s \in S\}$$

and hence  $|A + A| \leq |S||A|$ . Applying Lemma 8.10, we may find a subspace  $H \subset G \times G'$  such that  $|H|/|A| \in [K^{-10}, K^{10}]$  and  $A$  is covered by  $c + H$  with  $|c| \leq |S|^6|A|^{1/2}/|H|^{1/2}$ . If

we let  $H_0, H_1$  be as in Lemma 9.2, this implies on taking projections that  $G$  is covered by at most  $|c|$  translates of  $H_0$ . This implies that

$$|c||H_0| \geq |G|;$$

since  $|H_0||H_1| = |H|$ , we conclude that

$$|H_1| \leq |c||H|/|G| = |c||H|/|A|.$$

By hypothesis,  $A$  is covered by at most  $|c|$  translates of  $H$ , and hence by at most  $|c||H_1|$  translates of  $\{(x, \phi(x)) : x \in G\}$ . As  $\phi$  is a homomorphism, each such translate can be written in the form  $\{(x, \phi(x) + d) : x \in G\}$  for some  $d \in G'$ . Since

$$|c||H_1| \leq |c|^2 \frac{|H|}{|A|} \leq \left( |S|^6 \frac{|A|^{1/2}}{|H|^{1/2}} \right)^2 \frac{|H|}{|A|} = |S|^{12},$$

the result follows. □

## Chapter 10

# Approximate homomorphism version of PFR

**Definition 10.1** (Additive energy). *If  $G$  is a group, and  $A$  is a finite subset of  $G$ , the additive energy  $E(A)$  of  $A$  is the number of quadruples  $(a_1, a_2, a_3, a_4) \in A^4$  such that  $a_1 + a_2 = a_3 + a_4$ .*

**Lemma 10.2** (Cauchy–Schwarz bound). *If  $G$  is a group,  $A, B$  are finite subsets of  $G$ , then*

$$E(A) \geq \frac{|\{(a, a') \in A \times A : a + a' \in B\}|^2}{|B|}.$$

*Proof.* If  $B$  is empty then the claim is trivial (with the Lean convention  $0/0$ ), so without loss of generality  $B$  is non-empty. We can rewrite

$$|\{(a, a') \in A \times A : a + a' \in B\}| = \sum_{b \in B} r(b)$$

where  $r : G \rightarrow \mathbb{N}$  is the counting function

$$r(b) := |\{(a, a') \in A \times A : a + a' = b\}|.$$

From double counting we have

$$\sum_{b \in G} r(b)^2 = E(A).$$

The claim now follows from the Cauchy–Schwarz inequality

$$\left(\sum_{b \in B} r(b)\right)^2 \leq |B| \sum_{b \in B} r(b)^2.$$

□

**Lemma 10.3** (Balog–Szemerédi–Gowers lemma). *Let  $G$  be an abelian group, and let  $A$  be a finite non-empty set with  $E(A) \geq |A|^3/K$  for some  $K \geq 1$ . Then there is a subset  $A'$  of  $A$  with  $|A'| \geq |A|/(C_1 K^{C_2})$  and  $|A' - A'| \leq C_3 K^{C_4} |A|$ , where (provisionally)*

$$C_1 = 2^4, C_2 = 1, C_3 = 2^{10}, C_4 = 5.$$

*Proof.* See <https://terrytao.files.wordpress.com/2024/01/simplebsg.pdf>

□

**Theorem 10.4** (Approximate homomorphism form of PFR). *Let  $G, G'$  be finite abelian 2-groups. Let  $f : G \rightarrow G'$  be a function, and suppose that there are at least  $|G|^2/K$  pairs  $(x, y) \in G^2$  such that*

$$f(x + y) = f(x) + f(y).$$

*Then there exists a homomorphism  $\phi : G \rightarrow G'$  and a constant  $c \in G'$  such that  $f(x) = \phi(x) + c$  for at least  $|G|/(2^{172} * K^{146})$  values of  $x \in G$ .*

*Proof.* Consider the graph  $A \subset G \times G'$  defined by

$$A := \{(x, f(x)) : x \in G\}.$$

Clearly,  $|A| = |G|$ . By hypothesis, we have  $a + a' \in A$  for at least  $|A|^2/K$  pairs  $(a, a') \in A^2$ . By Lemma 10.2, this implies that  $E(A) \geq |A|^3/K^2$ . Applying Lemma 10.3, we conclude that there exists a subset  $A' \subset A$  with  $|A'| \geq |A|/C_1 K^{2C_2}$  and  $|A' + A'| \leq C_1 C_3 K^{2(C_2+C_4)} |A'|$ . Applying Lemma 8.10, we may find a subspace  $H \subset G \times G'$  such that  $|H|/|A'| \in [L^{-10}, L^{10}]$  and a subset  $c$  of cardinality at most  $L^6 |A'|^{1/2} / |H|^{1/2}$  such that  $A' \subseteq c + H$ , where  $L = C_1 C_3 K^{2(C_2+C_4)}$ . If we let  $H_0, H_1$  be as in Lemma 9.2, this implies on taking projections the projection of  $A'$  to  $G$  is covered by at most  $|c|$  translates of  $H_0$ . This implies that

$$|c| |H_0| \geq |A'|;$$

since  $|H_0| |H_1| = |H|$ , we conclude that

$$|H_1| \leq |c| |H| / |A'|.$$

By hypothesis,  $A'$  is covered by at most  $|c|$  translates of  $H$ , and hence by at most  $|c| |H_1|$  translates of  $\{(x, \phi(x)) : x \in G\}$ . As  $\phi$  is a homomorphism, each such translate can be written in the form  $\{(x, \phi(x) + c) : x \in G\}$  for some  $c \in G'$ . The number of translates is bounded by

$$|c|^2 \frac{|H|}{|A'|} \leq \left( L^6 \frac{|A'|^{1/2}}{|H|^{1/2}} \right)^2 \frac{|H|}{|A'|} = L^{12}.$$

By the pigeonhole principle, one of these translates must then contain at least  $|A'|/L^{12} \geq |G|/(C_1 C_3 K^{2(C_2+C_4)})^{12} (C_1 K^{2C_2})$  elements of  $A'$  (and hence of  $A$ ), and the claim follows.  $\square$

# Chapter 11

## Weak PFR over the integers

**Lemma 11.1.** *If  $G$  is torsion-free and  $X, Y$  are  $G$ -valued random variables then  $d[X; 2Y] \leq 5d[X; Y]$ .*

*Proof.* Let  $Y_1, Y_2$  be independent copies of  $Y$  (also independent of  $X$ ). Since  $G$  is torsion-free we know  $X, Y_1 - Y_2, X - 2Y_1$  uniquely determine  $X, Y_1, Y_2$  and so

$$\mathbb{H}(X, Y_1, Y_2, X - 2Y_1) = \mathbb{H}(X, Y_1, Y_2) = \mathbb{H}(X) + 2\mathbb{H}(Y).$$

Similarly

$$\mathbb{H}(X, X - 2Y_1) = \mathbb{H}(X) + \mathbb{H}(2Y_1) = \mathbb{H}(X) + \mathbb{H}(Y).$$

Furthermore

$$\mathbb{H}(Y_1 - Y_2, X - 2Y_1) = \mathbb{H}(Y_1 - Y_2, X - Y_1 - Y_2) \leq \mathbb{H}(Y_1 - Y_2) + \mathbb{H}(X - Y_1 - Y_2).$$

By submodularity (Corollary 2.21)

$$\mathbb{H}(X, Y_1, Y_2, X - 2Y_1) + \mathbb{H}(X - 2Y_1) \leq \mathbb{H}(X, X - 2Y_1) + \mathbb{H}(Y_1 - Y_2, X - 2Y_1).$$

Combining these inequalities

$$\mathbb{H}(X - 2Y_1) \leq \mathbb{H}(Y_1 - Y_2) + \mathbb{H}(X - Y_1 - Y_2) - \mathbb{H}(Y).$$

Similarly we have

$$\mathbb{H}(Y_1, Y_2, X - Y_1 - Y_2) = \mathbb{H}(X) + 2\mathbb{H}(Y),$$

$$\mathbb{H}(Y_1, X - Y_1 - Y_2) = \mathbb{H}(Y) + \mathbb{H}(X - Y_2),$$

and

$$\mathbb{H}(Y_2, X - Y_1 - Y_2) = \mathbb{H}(Y) + \mathbb{H}(X - Y_1)$$

and by submodularity (Corollary 2.21) again

$$\mathbb{H}(Y_1, Y_2, X - Y_1 - Y_2) + \mathbb{H}(X - Y_1 - Y_2) \leq \mathbb{H}(Y_1, X - Y_1 - Y_2) + \mathbb{H}(Y_2, X - Y_1 - Y_2).$$

Combining these inequalities (and recalling the definition of Ruzsa distance) gives

$$\mathbb{H}(X - Y_1 - Y_2) \leq \mathbb{H}(X - Y_1) + \mathbb{H}(X - Y_2) - \mathbb{H}(X) = 2d[X; Y] + \mathbb{H}(Y).$$

It follows that

$$\mathbb{H}(X - 2Y_1) \leq \mathbb{H}(Y_1 - Y_2) + 2d[X; Y]$$

and so (using  $\mathbb{H}(2Y) = \mathbb{H}(Y)$ )

$$\begin{aligned} d[X; 2Y] &= \mathbb{H}(X - 2Y_1) - \mathbb{H}(X)/2 - \mathbb{H}(2Y)/2 \\ &\leq \mathbb{H}(Y_1 - Y_2) + 2d[X; Y] - \mathbb{H}(X)/2 - \mathbb{H}(Y)/2 \\ &= d[Y_1; Y_2] + \frac{\mathbb{H}(Y) - \mathbb{H}(X)}{2} + 2d[X; Y]. \end{aligned}$$

Finally note that by the triangle inequality (Lemma 3.18) we have

$$d[Y_1; Y_2] \leq d[Y_1; X] + d[X; Y_2] = 2d[X; Y].$$

The result follows from  $(\mathbb{H}(Y) - \mathbb{H}(X))/2 \leq d[X; Y]$  (Lemma 3.13).  $\square$

**Lemma 11.2.** *If  $G$  is a torsion-free group and  $X, Y$  are  $G$ -valued random variables and  $\phi : G \rightarrow \mathbb{F}_2^d$  is a homomorphism then*

$$\mathbb{H}(\phi(X)) \leq 10d[X; Y].$$

*Proof.* By Corollary 5.2 and Lemma 11.1 we have

$$d[\phi(X); \phi(2Y)] \leq d[X; 2Y] \leq 5d[X; Y]$$

and  $\phi(2Y) = 2\phi(Y) \equiv 0$  so the left-hand side is equal to  $d[\phi(X); 0] = \mathbb{H}(\phi(X))/2$  (using Lemma 3.9).  $\square$

**Lemma 11.3.** *Let  $G = \mathbb{F}_2^n$  and  $\alpha \in (0, 1)$  and let  $X, Y$  be  $G$ -valued random variables such that*

$$\mathbb{H}(X) + \mathbb{H}(Y) > \frac{20}{\alpha} d[X; Y].$$

*There is a non-trivial subgroup  $H \leq G$  such that*

$$\log|H| < \frac{1 + \alpha}{2} (\mathbb{H}(X) + \mathbb{H}(Y))$$

*and*

$$\mathbb{H}(\psi(X)) + \mathbb{H}(\psi(Y)) < \alpha(\mathbb{H}(X) + \mathbb{H}(Y))$$

*where  $\psi : G \rightarrow G/H$  is the natural projection homomorphism.*

*Proof.* By Theorem 8.9 there exists a subgroup  $H$  such that  $d[X; U_H] + d[Y; U_H] \leq 10d[X; Y]$ . Using Lemma 3.16 we deduce that  $\mathbb{H}(\psi(X)) + \mathbb{H}(\psi(Y)) \leq 20d[X; Y]$ . The second claim follows adding these inequalities and using the assumption on  $\mathbb{H}(X) + \mathbb{H}(Y)$ .

Furthermore we have by Lemma 3.13

$$\log|H| - \mathbb{H}(X) \leq 2d[X; U_H]$$

and similarly for  $Y$  and thus

$$\begin{aligned} \log|H| &\leq \frac{\mathbb{H}(X) + \mathbb{H}(Y)}{2} + d[X; U_H] + d[Y; U_H] \leq \frac{\mathbb{H}(X) + \mathbb{H}(Y)}{2} + 10d[X; Y] \\ &< \frac{1 + \alpha}{2} (\mathbb{H}(X) + \mathbb{H}(Y)). \end{aligned}$$

Finally note that if  $H$  were trivial then  $\psi(X) = X$  and  $\psi(Y) = Y$  and hence  $\mathbb{H}(X) + \mathbb{H}(Y) = 0$ , which contradicts Lemma 3.15.  $\square$

**Lemma 11.4.** *If  $G = \mathbb{F}_2^d$  and  $\alpha \in (0, 1)$  and  $X, Y$  are  $G$ -valued random variables then there is a subgroup  $H \leq \mathbb{F}_2^d$  such that*

$$\log|H| \leq \frac{1 + \alpha}{2(1 - \alpha)}(\mathbb{H}(X) + \mathbb{H}(Y))$$

and if  $\psi : G \rightarrow G/H$  is the natural projection then

$$\mathbb{H}(\psi(X)) + \mathbb{H}(\psi(Y)) \leq \frac{20}{\alpha}d[\psi(X); \psi(Y)].$$

*Proof.* Let  $H \leq \mathbb{F}_2^d$  be a maximal subgroup such that

$$\mathbb{H}(\psi(X)) + \mathbb{H}(\psi(Y)) > \frac{20}{\alpha}d[\psi(X); \psi(Y)]$$

and such that there exists  $c \geq 0$  with

$$\log|H| \leq \frac{1 + \alpha}{2(1 - \alpha)}(1 - c)(\mathbb{H}(X) + \mathbb{H}(Y))$$

and

$$\mathbb{H}(\psi(X)) + \mathbb{H}(\psi(Y)) \leq c(\mathbb{H}(X) + \mathbb{H}(Y)).$$

Note that this exists since  $H = \{0\}$  is an example of such a subgroup or we are done with this choice of  $H$ .

We know that  $G/H$  is a 2-elementary group and so by Lemma 11.3 there exists some non-trivial subgroup  $H' \leq G/H$  such that

$$\log|H'| < \frac{1 + \alpha}{2}(\mathbb{H}(\psi(X)) + \mathbb{H}(\psi(Y)))$$

and

$$\mathbb{H}(\psi' \circ \psi(X)) + \mathbb{H}(\psi' \circ \psi(Y)) < \alpha(\mathbb{H}(\psi(X)) + \mathbb{H}(\psi(Y)))$$

where  $\psi' : G/H \rightarrow (G/H)/H'$ . By group isomorphism theorems we know that there exists some  $H''$  with  $H \leq H'' \leq G$  such that  $H' \cong H''/H$  and  $\psi' \circ \psi(X) = \psi''(X)$  where  $\psi'' : G \rightarrow G/H''$  is the projection homomorphism.

Since  $H'$  is non-trivial we know that  $H$  is a proper subgroup of  $H''$ . On the other hand we know that

$$\log|H''| = \log|H'| + \log|H| < \frac{1 + \alpha}{2(1 - \alpha)}(1 - \alpha c)(\mathbb{H}(X) + \mathbb{H}(Y))$$

and

$$\mathbb{H}(\psi''(X)) + \mathbb{H}(\psi''(Y)) < \alpha(\mathbb{H}(\psi(X)) + \mathbb{H}(\psi(Y))) \leq \alpha c(\mathbb{H}(X) + \mathbb{H}(Y)).$$

Therefore (using the maximality of  $H$ ) it must be the first condition that fails, whence

$$\mathbb{H}(\psi''(X)) + \mathbb{H}(\psi''(Y)) \leq \frac{20}{\alpha}d[\psi''(X); \psi''(Y)].$$

□

We could use the previous lemma for any value of  $\alpha \in (0, 1)$ , which would give a whole range of estimates in Theorem 11.10. For definiteness, we specialize only to  $\alpha = 3/5$ , which gives a constant 2 in the first bound below.

**Lemma 11.5.** *If  $G = \mathbb{F}_2^d$  and  $\alpha \in (0, 1)$  and  $X, Y$  are  $G$ -valued random variables then there is a subgroup  $H \leq \mathbb{F}_2^d$  such that*

$$\log|H| \leq 2(\mathbb{H}(X) + \mathbb{H}(Y))$$

and if  $\psi : G \rightarrow G/H$  is the natural projection then

$$\mathbb{H}(\psi(X)) + \mathbb{H}(\psi(Y)) \leq 34d[\psi(X); \psi(Y)].$$

*Proof.* Specialize Lemma 11.4 to  $\alpha = 3/5$ . In the second inequality, it gives a bound  $100/3 < 34$ .  $\square$

**Lemma 11.6.** *Let  $\phi : G \rightarrow H$  be a homomorphism and  $A, B \subseteq G$  be finite subsets. If  $x, y \in H$  then let  $A_x = A \cap \phi^{-1}(x)$  and  $B_y = B \cap \phi^{-1}(y)$ . There exist  $x, y \in H$  such that  $A_x, B_y$  are both non-empty and*

$$d[\phi(U_A); \phi(U_B)] \log \frac{|A||B|}{|A_x||B_y|} \leq (\mathbb{H}(\phi(U_A)) + \mathbb{H}(\phi(U_B)))(d(U_A, U_B) - d(U_{A_x}, U_{B_y})).$$

*Proof.* The random variables  $(U_A \mid \phi(U_A) = x)$  and  $(U_B \mid \phi(U_B) = y)$  are equal in distribution to  $U_{A_x}$  and  $U_{B_y}$  respectively (both are uniformly distributed over their respective fibres). It follows from Proposition 5.1 that

$$\begin{aligned} \sum_{x, y \in H} \frac{|A_x||B_y|}{|A||B|} d[U_{A_x}; U_{B_y}] &= d[U_A \mid \phi(U_A); U_B \mid \phi(U_B)] \\ &\leq d[U_A; U_B] - d[\phi(U_A); \phi(U_B)]. \end{aligned}$$

Therefore with  $M := \mathbb{H}(\phi(U_A)) + \mathbb{H}(\phi(U_B))$  we have

$$\left( \sum_{x, y \in H} \frac{|A_x||B_y|}{|A||B|} M d[U_{A_x}; U_{B_y}] \right) + M d[\phi(U_A); \phi(U_B)] \leq M d[U_A; U_B].$$

Since

$$M = \sum_{x, y \in H} \frac{|A_x||B_y|}{|A||B|} \log \frac{|A||B|}{|A_x||B_y|}$$

we have

$$\sum_{x, y \in H} \frac{|A_x||B_y|}{|A||B|} \left( M d[U_{A_x}; U_{B_y}] + d[\phi(U_A); \phi(U_B)] \log \frac{|A||B|}{|A_x||B_y|} \right) \leq M d[U_A; U_B].$$

It follows that there exists some  $x, y \in H$  such that  $|A_x|, |B_y| \neq 0$  and

$$M d[U_{A_x}; U_{B_y}] + d[\phi(U_A); \phi(U_B)] \log \frac{|A||B|}{|A_x||B_y|} \leq M d[U_A; U_B].$$

$\square$

**Definition 11.7.** *If  $A \subseteq \mathbb{Z}^d$  then by  $\dim(A)$  we mean the dimension of the span of  $A - A$  over the reals – equivalently, the smallest  $d'$  such that  $A$  lies in a coset of a subgroup isomorphic to  $\mathbb{Z}^{d'}$ .*

**Theorem 11.8.** *If  $A, B \subseteq \mathbb{Z}^d$  are finite non-empty sets then there exist non-empty  $A' \subseteq A$  and  $B' \subseteq B$  such that*

$$\log \frac{|A||B|}{|A'||B'|} \leq 34d[U_A; U_B]$$

*such that  $\max(\dim A', \dim B') \leq \frac{40}{\log 2} d[U_A; U_B]$ .*

*Proof.* Without loss of generality we can assume that  $A$  and  $B$  are not both inside (possibly distinct) cosets of the same subgroup of  $\mathbb{Z}^d$ , or we just replace  $\mathbb{Z}^d$  with that subgroup. We prove the result by induction on  $|A| + |B|$ .

Let  $\phi : \mathbb{Z}^d \rightarrow \mathbb{F}_2^d$  be the natural mod-2 homomorphism. By Lemma 11.2

$$\max(\mathbb{H}(\phi(U_A)), \mathbb{H}(\phi(U_B))) \leq 10d[U_A; U_B].$$

We now apply Lemma 11.5, obtaining some subgroup  $H \leq \mathbb{F}_2^d$  such that

$$\log|H| \leq 40d[U_A; U_B]$$

and

$$\mathbb{H}(\tilde{\phi}(U_A)) + \mathbb{H}(\tilde{\phi}(U_B)) \leq 34d[\tilde{\phi}(U_A); \tilde{\phi}(U_B)]$$

where  $\tilde{\phi} : \mathbb{Z}^d \rightarrow \mathbb{F}_2^d/H$  is  $\phi$  composed with the projection onto  $\mathbb{F}_2^d/H$ .

By Lemma 11.6 there exist  $x, y \in \mathbb{F}_2^d/H$  such that, with  $A_x = A \cap \tilde{\phi}^{-1}(x)$  and similarly for  $B_y$ ,

$$\log \frac{|A||B|}{|A_x||B_y|} \leq 34(d[U_A; U_B] - d[U_{A_x}; U_{B_y}]).$$

Suppose first that  $|A_x| + |B_y| = |A| + |B|$ . This means that  $\tilde{\phi}(A) = \{x\}$  and  $\tilde{\phi}(B) = \{y\}$ , and hence both  $A$  and  $B$  are in cosets of  $\ker \tilde{\phi}$ . Since by assumption  $A, B$  are not in cosets of a proper subgroup of  $\mathbb{Z}^d$  this means  $\ker \tilde{\phi} = \mathbb{Z}^d$ , and so (examining the definition of  $\tilde{\phi}$ ) we must have  $H = \mathbb{F}_2^d$ . Then our bound on  $\log|H|$  forces  $d \leq \frac{40}{\log 2} d[U_A; U_B]$  and we are done with  $A' = A$  and  $B' = B$ .

Otherwise,

$$|A_x| + |B_y| < |A| + |B|.$$

By induction we can find some  $A' \subseteq A_x$  and  $B' \subseteq B_y$  such that  $\dim A', \dim B' \leq \frac{40}{\log 2} d[U_{A_x}; U_{B_y}] \leq \frac{40}{\log 2} d[U_A; U_B]$  and

$$\log \frac{|A_x||B_y|}{|A'||B'|} \leq 34d[U_{A_x}; U_{B_y}].$$

Adding these inequalities implies

$$\log \frac{|A||B|}{|A'||B'|} \leq 34d[U_A; U_B]$$

as required. □

**Theorem 11.9.** *If  $A \subseteq \mathbb{Z}^d$  is a finite non-empty set with  $d[U_A; U_A] \leq \log K$  then there exists a non-empty  $A' \subseteq A$  such that*

$$|A'| \geq K^{-17}|A|$$

*and  $\dim A' \leq \frac{40}{\log 2} \log K$ .*

*Proof.* Immediate from Theorem 11.8 and rearranging.  $\square$

**Theorem 11.10.** *Let  $A \subseteq \mathbb{Z}^d$  and  $|A - A| \leq K|A|$ . There exists  $A' \subseteq A$  such that  $|A'| \geq K^{-17}|A|$  and  $\dim A' \leq \frac{40}{\log 2} \log K$ .*

*Proof.* As in the beginning of Theorem 7.3 the doubling condition forces  $d[U_A; U_A] \leq \log K$ , and then we apply Theorem 11.9.  $\square$

# Chapter 12

## The $m$ -torsion case

### 12.1 Data processing inequality

**Lemma 12.1** (Data processing for a single variable). *Let  $X$  be a random variable. Then for any function  $f$  on the range of  $X$ , one has  $\mathbb{H}[f(X)] \leq \mathbb{H}[X]$ .*

*Proof.* We have

$$\mathbb{H}[X] = \mathbb{H}[X, f(X)] = \mathbb{H}[f(X)] + \mathbb{H}[X|f(X)]$$

thanks to Lemma 2.2 and Lemma 2.13, giving the claim.  $\square$

**Lemma 12.2** (One-sided unconditional data processing inequality). *Let  $X, Y$  be random variables. For any function  $f, g$  on the range of  $X$ , we have  $\mathbb{I}[f(X) : Y] \leq \mathbb{I}[X : Y]$ .*

*Proof.* By Lemma 2.16 it suffices to show that  $\mathbb{H}[Y|X] \leq \mathbb{H}[Y|f(X)]$ . But this follows from Corollary 2.20 (and Lemma 2.2).  $\square$

**Lemma 12.3** (Unconditional data processing inequality). *Let  $X, Y$  be random variables. For any functions  $f, g$  on the ranges of  $X, Y$  respectively, we have  $\mathbb{I}[f(X) : g(Y)] \leq \mathbb{I}[X : Y]$ .*

*Proof.* From Lemma 12.2, Lemma 2.9 we have  $\mathbb{I}[f(X) : Y] \leq \mathbb{I}[X : Y]$  and  $\mathbb{I}[f(X) : g(Y)] \leq \mathbb{I}[f(X) : Y]$ , giving the claim.  $\square$

**Lemma 12.4** (Data processing inequality). *Let  $X, Y, Z$ . For any functions  $f, g$  on the ranges of  $X, Y$  respectively, we have  $\mathbb{I}[f(X) : g(Y)|Z] \leq \mathbb{I}[X : Y|Z]$ .*

*Proof.* Apply Lemma 12.3 to  $X, Y$  conditioned to the event  $Z = z$ , multiply by  $\mathbf{P}[Z = z]$ , and sum using Definition 2.25.  $\square$

### 12.2 More Ruzsa distance estimates

Let  $G$  be an additive group.

**Lemma 12.5** (Flipping a sign). *If  $X, Y$  are  $G$ -valued, then*

$$d[X; -Y] \leq 3d[X; Y].$$

*Proof.* Without loss of generality (using Lemma 3.10 and Lemma 3.7) we may take  $X, Y$  to be independent. By  $(X_1, Y_1), (X_2, Y_2)$  be copies of  $(X, Y)$  that are conditionally independent over  $X_1 - Y_1 = X_2 - Y_2$  (this exists thanks to Lemma 3.22). By Lemma 3.7, we can also find another copy  $(X_3, Y_3)$  of  $(X, Y)$  that is independent of  $X_1, Y_1, X_2, Y_2$ . From Corollary 2.21, one has

$$\mathbb{H}[X_3 - Y_2, X_1 - Y_3, X_2, Y_1, X_3, Y_3, X_3 + Y_3] + \mathbb{H}[X_3 + Y_3] \leq \mathbb{H}[X_3 - Y_2, X_1 - Y_3, X_2, Y_1, X_3 + Y_3] + \mathbb{H}[X_3, Y_3, X_3 + Y_3].$$

From Lemma 3.11, Lemma 3.1, Lemma 3.10 we have

$$\mathbb{H}[X_3 + Y_3] = \frac{1}{2}\mathbb{H}[X_3] + \frac{1}{2}\mathbb{H}[-Y_3] + d[X_3; -Y_3] = \frac{1}{2}\mathbb{H}[X] + \frac{1}{2}\mathbb{H}[Y] + d[X; -Y].$$

Since  $X_3 + Y_3$  is a function of  $X_3, Y_3$ , we see from Lemma 2.2 and Corollary 2.24 that

$$\mathbb{H}[X_3, Y_3, X_3 + Y_3] = \mathbb{H}[X_3, Y_3] = \mathbb{H}[X, Y] = \mathbb{H}[X] + \mathbb{H}[Y].$$

Because  $X_1 - Y_1 = X_2 - Y_2$ , we have

$$X_3 + Y_3 = (X_3 - Y_2) - (X_1 - Y_3) + (X_2 + Y_1)$$

and thus by Lemma 2.2

$$\mathbb{H}[X_3 - Y_2, X_1 - Y_3, X_2, Y_1, X_3 + Y_3] = \mathbb{H}[X_3 - Y_2, X_1 - Y_3, X_2, Y_1]$$

and hence by Corollary 2.18

$$\mathbb{H}[X_3 - Y_2, X_1 - Y_3, X_2, Y_1, X_3 + Y_3] \leq \mathbb{H}[X_3 - Y_2] + \mathbb{H}[X_1 - Y_3] + \mathbb{H}[X_2] + \mathbb{H}[Y_1].$$

Since  $X_3, Y_2$  are independent, we see from Lemma 3.11, Lemma 3.10 that

$$\mathbb{H}[X_3 - Y_2] = \frac{1}{2}\mathbb{H}[X] + \frac{1}{2}\mathbb{H}[Y] + d[X; Y].$$

Similarly

$$\mathbb{H}[X_1 - Y_3] = \frac{1}{2}\mathbb{H}[X] + \frac{1}{2}\mathbb{H}[Y] + d[X; Y].$$

We conclude that

$$\mathbb{H}[X_3 - Y_2, X_1 - Y_3, X_2, Y_1, X_3 + Y_3] \leq 2\mathbb{H}[X] + 2\mathbb{H}[Y] + 2d[X; Y].$$

Finally, from Lemma 12.1 we have

$$\mathbb{H}[X_1, Y_1, X_2, Y_2, X_3, Y_3] \leq \mathbb{H}[X_3 - Y_2, X_1 - Y_3, X_2, Y_1, X_3, Y_3, X_3 + Y_3].$$

From Corollary 2.24 followed by Corollary 2.30, we have

$$\mathbb{H}[X_1, Y_1, X_2, Y_2, X_3, Y_3] = \mathbb{H}[X_1, Y_1, X_1 - Y_1] + \mathbb{H}[X_2, Y_2, X_2 - Y_2] - \mathbb{H}[X_1 - Y_1] + \mathbb{H}[X_3, Y_3]$$

and thus by Lemma 3.11, Lemma 3.10, Lemma 2.2, Corollary 2.24

$$\mathbb{H}[X_1, Y_1, X_2, Y_2, X_3, Y_3] = \mathbb{H}[X] + \mathbb{H}[Y] + \mathbb{H}[X] + \mathbb{H}[Y] - \left(\frac{1}{2}\mathbb{H}[X] + \frac{1}{2}\mathbb{H}[Y] + d[X; Y]\right) + \mathbb{H}[X] + \mathbb{H}[Y].$$

Applying all of these estimates, the claim now follows from linear arithmetic.  $\square$

**Lemma 12.6** (Kaimonovich–Vershik–Madiman inequality). *If  $n \geq 0$  and  $X, Y_1, \dots, Y_n$  are jointly independent  $G$ -valued random variables, then*

$$\mathbb{H} \left[ X + \sum_{i=1}^n Y_i \right] - \mathbb{H}[X] \leq \sum_{i=1}^n (\mathbb{H}[X + Y_i] - \mathbb{H}[X]).$$

*Proof.* This is trivial for  $n = 0, 1$ , while the  $n = 2$  case is Lemma 3.21. Now suppose inductively that  $n > 2$ , and the claim was already proven for  $n - 1$ . By a further application of Lemma 3.21 one has

$$\mathbb{H} \left[ X + \sum_{i=1}^n Y_i \right] - \mathbb{H} \left[ X + \sum_{i=1}^{n-1} Y_i \right] \leq \mathbb{H}[X + Y_n] - \mathbb{H}[X].$$

By induction hypothesis one has

$$\mathbb{H} \left[ X + \sum_{i=1}^{n-1} Y_i \right] - \mathbb{H}[X] \leq \sum_{i=1}^{n-1} (\mathbb{H}[X + Y_i] - \mathbb{H}[X]).$$

Summing the two inequalities, we obtain the claim.  $\square$

**Lemma 12.7** (Kaimonovich–Vershik–Madiman inequality, II). *If  $n \geq 1$  and  $X, Y_1, \dots, Y_n$  are jointly independent  $G$ -valued random variables, then*

$$d[X; \sum_{i=1}^n Y_i] \leq 2 \sum_{i=1}^n d[X; Y_i].$$

*Proof.* Applying Lemma 12.6 with all the  $Y_i$  replaced by  $-Y_i$ , and using Lemma 3.1 and Lemma 3.11, we obtain after some rearranging

$$d[X; \sum_{i=1}^n Y_i] + \frac{1}{2} (\mathbb{H}[\sum_{i=1}^n Y_i] - \mathbb{H}[X]) \leq \sum_{i=1}^n \left( d[X; Y_i] + \frac{1}{2} (\mathbb{H}[Y_i] - \mathbb{H}[X]) \right).$$

From Corollary 3.5 we have

$$\mathbb{H}[\sum_{i=1}^n Y_i] \geq \mathbb{H}[Y_i]$$

for all  $i$ ; subtracting  $\mathbb{H}[X]$  and averaging, we conclude that

$$\mathbb{H}[\sum_{i=1}^n Y_i] - \mathbb{H}[X] \geq \frac{1}{n} \sum_{i=1}^n (\mathbb{H}[Y_i] - \mathbb{H}[X])$$

and thus

$$d[X; \sum_{i=1}^n Y_i] \leq \sum_{i=1}^n d[X; Y_i] + \frac{n-1}{2n} (\mathbb{H}[Y_i] - \mathbb{H}[X]).$$

From Lemma 3.13 we have

$$\mathbb{H}[Y_i] - \mathbb{H}[X] \leq 2d[X; Y_i].$$

Since  $0 \leq \frac{n-1}{2n} \leq \frac{1}{2}$ , the claim follows.  $\square$

**Lemma 12.8** (Kaimonovich–Vershik–Madiman inequality, III). *If  $n \geq 1$  and  $X, Y_1, \dots, Y_n$  are jointly independent  $G$ -valued random variables, then*

$$d \left[ X; \sum_{i=1}^n Y_i \right] \leq d[X; Y_1] + \frac{1}{2} \left( \mathbb{H} \left[ \sum_{i=1}^n Y_i \right] - \mathbb{H}[Y_1] \right).$$

*Proof.* From Lemma 3.21 one has

$$\mathbb{H} \left[ -X + \sum_{i=1}^n Y_i \right] \leq \mathbb{H}[-X + Y_1] + \mathbb{H} \left[ \sum_{i=1}^n Y_i \right] - \mathbb{H}[Y_1].$$

The claim then follows from Lemma 3.11 and some elementary algebra.  $\square$

**Lemma 12.9** (Comparing sums). *Let  $(X_i)_{1 \leq i \leq m}$  and  $(Y_j)_{1 \leq j \leq l}$  be tuples of jointly independent random variables (so the  $X$ 's and  $Y$ 's are also independent of each other), and let  $f : \{1, \dots, l\} \rightarrow \{1, \dots, m\}$  be a function, then*

$$\mathbb{H} \left[ \sum_{j=1}^l Y_j \right] \leq \mathbb{H} \left[ \sum_{i=1}^m X_i \right] + \sum_{j=1}^l (\mathbb{H}[Y_j - X_{f(j)}] - \mathbb{H}[X_{f(j)}]).$$

*Proof.* Write  $W := \sum_{i=1}^m X_i$ . From Corollary 3.5 we have

$$\mathbb{H} \left[ \sum_{j=1}^l Y_j \right] \leq \mathbb{H}[-W + \sum_{j=1}^l Y_j]$$

while from Lemma 12.6 one has

$$\mathbb{H}[-W + \sum_{j=1}^l Y_j] \leq \mathbb{H}[-W] + \sum_{j=1}^l \mathbb{H}[-W + Y_j] - \mathbb{H}[-W].$$

From Lemma 3.21 one has

$$\mathbb{H}[-W + Y_j] - \mathbb{H}[-W] \leq \mathbb{H}[-X_{f(j)} + Y_j] - \mathbb{H}[-X_{f(j)}].$$

The claim now follows from Lemma 3.1 and some elementary algebra.  $\square$

**Lemma 12.10** (Sums of dilates I). *Let  $X, Y, X'$  be independent  $G$ -valued random variables, with  $X'$  a copy of  $X$ , and let  $a$  be an integer. Then*

$$\mathbb{H}[X - (a+1)Y] \leq \mathbb{H}[X - aY] + \mathbb{H}[X - Y - X'] - \mathbb{H}[X]$$

and

$$\mathbb{H}[X - (a-1)Y] \leq \mathbb{H}[X - aY] + \mathbb{H}[X - Y - X'] - \mathbb{H}[X].$$

*Proof.* From Lemma 3.17 we have

$$\mathbb{H}[(X - Y) - aY] \leq \mathbb{H}[(X - Y) - X'] + \mathbb{H}[X' - aY] - \mathbb{H}[X']$$

which gives the first inequality. Similarly from Lemma 3.17 we have

$$\mathbb{H}[(X + Y) - aY] \leq \mathbb{H}[(X + Y) - X'] + \mathbb{H}[X' - aY] - \mathbb{H}[X']$$

which (when combined with Lemma 3.1) gives the second inequality.  $\square$

**Lemma 12.11** (Sums of dilates II). *Let  $X, Y$  be independent  $G$ -valued random variables, and let  $a$  be an integer. Then*

$$\mathbb{H}[X - aY] - \mathbb{H}[X] \leq 4|a|d[X; Y].$$

*Proof.* From Lemma 3.21 one has

$$\mathbb{H}[Y - X + X'] - \mathbb{H}[Y - X] \leq \mathbb{H}[Y + X'] - \mathbb{H}[Y] = \mathbb{H}[Y + X] - \mathbb{H}[Y]$$

which by Lemma 3.11 gives

$$\mathbb{H}[X - Y - X'] - \mathbb{H}[X] \leq d[X; Y] + d[X; -Y]$$

and hence by Lemma 12.5

$$\mathbb{H}[X - Y - X'] - \mathbb{H}[X] \leq 4d[X; Y].$$

From Lemma 12.10 we then have

$$\mathbb{H}[X - (a \pm 1)Y] \leq \mathbb{H}[X - aY] + 4d[X; Y]$$

and the claim now follows by an induction on  $|a|$ . □

We remark that in the paper [GGMT2024] the variant estimate

$$\mathbb{H}[X - aY] - \mathbb{H}[X] \leq (4 + 10\lceil \log_2 |a| \rceil)d[X; Y]$$

is also proven by a similar method. This variant is superior for  $|a| \geq 9$  (or  $|a| = 7$ ); but we will not need this estimate here.

## 12.3 Multidistance

We continue to let  $G$  be an abelian group.

**Definition 12.12** (Multidistance). *Let  $m$  be a positive integer, and let  $X_{[m]} = (X_i)_{1 \leq i \leq m}$  be an  $m$ -tuple of  $G$ -valued random variables  $X_i$ . Then we define*

$$D[X_{[m]}] := \mathbb{H}\left[\sum_{i=1}^m \tilde{X}_i\right] - \frac{1}{m} \sum_{i=1}^m \mathbb{H}[\tilde{X}_i],$$

where the  $\tilde{X}_i$  are independent copies of the  $X_i$ .

**Lemma 12.13** (Multidistance of copy). *If  $X_{[m]} = (X_i)_{1 \leq i \leq m}$  and  $Y_{[m]} = (Y_i)_{1 \leq i \leq m}$  are such that  $X_i$  and  $Y_i$  have the same distribution for each  $i$ , then  $D[X_{[m]}] = D[Y_{[m]}]$ .*

*Proof.* Clear from Lemma 3.6. □

**Lemma 12.14** (Multidistance of independent variables). *If  $X_{[m]} = (X_i)_{1 \leq i \leq m}$  are jointly independent, then  $D[X_{[m]}] = \mathbb{H}[\sum_{i=1}^m X_i] - \frac{1}{m} \sum_{i=1}^m \mathbb{H}[X_i]$ .*

*Proof.* Clear from definition. □

**Lemma 12.15** (Nonnegativity). *For any such tuple, we have  $D[X_{[m]}] \geq 0$ .*

*Proof.* From Corollary 3.5 one has

$$\mathbb{H}[\sum_{i=1}^m \tilde{X}_i] \geq \mathbb{H}[\tilde{X}_i]$$

for each  $1 \leq i \leq m$ . Averaging over  $i$ , we obtain the claim.  $\square$

**Lemma 12.16** (Relabeling). *If  $\phi : \{1, \dots, m\} \rightarrow \{1, \dots, m\}$  is a bijection, then  $D[X_{[m]}] = D[(X_{\phi(j)})_{1 \leq j \leq m}]$ .*

*Proof.* Trivial.  $\square$

**Lemma 12.17** (Multidistance and Ruzsa distance, I). *Let  $m \geq 2$ , and let  $X_{[m]}$  be a tuple of  $G$ -valued random variables. Then*

$$\sum_{1 \leq j, k \leq m: j \neq k} d[X_j; -X_k] \leq m(m-1)D[X_{[m]}].$$

*Proof.* By Lemma 3.10, Lemma 12.13 we may take the  $X_i$  to be jointly independent. From Corollary 3.5, we see that for any distinct  $1 \leq j, k \leq m$ , we have

$$\mathbb{H}[X_j + X_k] \leq \mathbb{H}[\sum_{i=1}^m X_i],$$

and hence by Lemma 3.11

$$d[X_j; -X_k] \leq \mathbb{H}[\sum_{i=1}^m X_i] - \frac{1}{2}\mathbb{H}[X_j] - \frac{1}{2}\mathbb{H}[X_k].$$

Summing this over all pairs  $(j, k)$ ,  $j \neq k$  and using Lemma 12.14, we obtain the claim.  $\square$

**Lemma 12.18** (Multidistance and Ruzsa distance, II). *Let  $m \geq 2$ , and let  $X_{[m]}$  be a tuple of  $G$ -valued random variables. Then*

$$\sum_{j=1}^m d[X_j; X_j] \leq 2mD[X_{[m]}].$$

*Proof.* From Lemma 3.18 we have  $\text{dist } X_j X_j \leq 2 \text{dist } X_j - X_k$ , and applying this to every summand in Lemma 12.17, we obtain the claim.  $\square$

**Lemma 12.19** (Multidistance and Ruzsa distance, III). *Let  $m \geq 2$ , and let  $X_{[m]}$  be a tuple of  $G$ -valued random variables. If the  $X_i$  all have the same distribution, then  $D[X_{[m]}] \leq md[X_i; X_i]$  for any  $1 \leq i \leq m$ .*

*Proof.* By Lemma 3.10, Lemma 12.13 we may take the  $X_i$  to be jointly independent. Let  $X_0$  be a further independent copy of the  $X_i$ . From Lemma 12.6, we have

$$\mathbb{H}[-X_0 + \sum_{i=1}^m X_i] - \mathbb{H}[-X_0] \leq \sum_{i=1}^m \mathbb{H}[X_0 - X_i] - \mathbb{H}[-X_0]$$

and hence by Lemma 3.1 and Lemma 3.11

$$\mathbb{H}[-X_0 + \sum_{i=1}^m X_i] - \mathbb{H}[X_0] \leq md[X_i, X_i].$$

On the other hand, by Corollary 3.5 we have

$$\mathbb{H}\left[\sum_{i=1}^m X_i\right] \leq \mathbb{H}\left[-X_0 + \sum_{i=1}^m X_i\right]$$

and the claim follows.  $\square$

**Lemma 12.20** (Multidistance and Ruzsa distance, IV). *Let  $m \geq 2$ , and let  $X_{[m]}$  be a tuple of independent  $G$ -valued random variables. Let  $W := \sum_{i=1}^m X_i$ . Then*

$$d[W; -W] \leq 2D[X_i].$$

*Proof.* Take  $(X'_i)_{1 \leq i \leq m}$  to be further independent copies of  $(X_i)_{1 \leq i \leq m}$  (which exist by Lemma 3.7), and write  $W' := \sum_{i=1}^m X'_i$ . Fix any distinct  $a, b \in I$ .

From Lemma 3.21 one has

$$\mathbb{H}[W + W'] \leq \mathbb{H}[W] + \mathbb{H}[X_a + W'] - \mathbb{H}[X_a] \quad (12.1)$$

and also

$$\mathbb{H}[X_a + W'] \leq \mathbb{H}[X_a + X_b] + \mathbb{H}[W'] - \mathbb{H}[X'_b].$$

Combining this with (12.1) and then applying Corollary 3.5 we have

$$\begin{aligned} \mathbb{H}[W + W'] &\leq 2\mathbb{H}[W] + \mathbb{H}[X_a + X_b] - \mathbb{H}[X_a] - \mathbb{H}[X_b] \\ &\leq 3\mathbb{H}[W] - \mathbb{H}[X_a] - \mathbb{H}[X_b]. \end{aligned}$$

Averaging this over all choices of  $(a, b)$  gives  $\mathbb{H}[W] + 2D[X_{[m]}]$ , and the claim follows from Lemma 3.11.  $\square$

**Proposition 12.21** (Vanishing). *If  $D[X_{[m]}] = 0$ , then for each  $1 \leq i \leq m$  there is a finite subgroup  $H_i \leq G$  such that  $d[X_i; U_{H_i}] = 0$ .*

*Proof.* From Lemma 12.17 and Lemma 3.15 we have  $d[X_j; X_{-k}] = 0$  for all  $1 \leq j, k \leq m$ . The claim now follows from Corollary 4.6.  $\square$

With more effort one can show that  $H_i$  is independent of  $i$ , but we will not need to do so here.

## 12.4 The tau functional

Fix  $m \geq 2$ , and a reference variable  $X^0$  in  $G$ .

**Definition 12.22** ( $\eta$ ). *We set  $\eta := \frac{1}{32m^3}$ .*

**Definition 12.23** ( $\tau$ -functional). *If  $(X_i)_{1 \leq i \leq m}$  is a tuple, we define its  $\tau$ -functional*

$$\tau[(X_i)_{1 \leq i \leq m}] := D[(X_i)_{1 \leq i \leq m}] + \eta \sum_{i=1}^m d[X_i; X^0].$$

**Definition 12.24** ( $\tau$ -minimizer). *A  $\tau$ -minimizer is a tuple  $(X_i)_{1 \leq i \leq m}$  that minimizes the  $\tau$ -functional among all tuples of  $G$ -valued random variables.*

**Proposition 12.25** (Existence of  $\tau$ -minimizer). *If  $G$  is finite, then a  $\tau$ -minimizer exists.*

*Proof.* This is similar to the proof of Proposition 6.5.  $\square$

**Proposition 12.26** (Minimizer close to reference variables). *If  $(X_i)_{1 \leq i \leq m}$  is a  $\tau$ -minimizer, then  $\sum_{i=1}^m d[X_i; X^0] \leq \frac{2m}{\eta} d[X^0; X^0]$ .*

*Proof.* By Definition 12.24 we have

$$\tau[(X_i)_{1 \leq i \leq m}] \leq \tau[(X^0)_{1 \leq i \leq m}]$$

and hence by Definition 12.23 and Lemma 12.15

$$\eta \sum_{i=1}^m d[X_i; X^0] \leq D[(X^0)_{1 \leq i \leq m}] + md[X^0; X^0].$$

The claim now follows from Lemma 12.19.  $\square$

**Lemma 12.27** (Lower bound on multidistance). *If  $(X_i)_{1 \leq i \leq m}$  is a  $\tau$ -minimizer, and  $k := D[(X_i)_{1 \leq i \leq m}]$ , then for any other tuple  $(X'_i)_{1 \leq i \leq m}$ , one has*

$$k - D[(X'_i)_{1 \leq i \leq m}] \leq \eta \sum_{i=1}^m d[X_i; X'_i].$$

*Proof.* By Definition 12.24 we have

$$\tau[(X_i)_{1 \leq i \leq m}] \leq \tau[(X'_i)_{1 \leq i \leq m}]$$

and hence by Definition 12.23

$$k + \eta \sum_{i=1}^m d[X_i; X^0] \leq D[(X'_i)_{1 \leq i \leq m}] + \eta \sum_{i=1}^m d[X'_i; X^0].$$

On the other hand, by Lemma 3.18 we have

$$d[X'_i; X^0] \leq d[X_i; X^0] + d[X_i; X'_i].$$

The claim follows.  $\square$

**Definition 12.28** (Conditional multidistance). *If  $X_{[m]} = (X_i)_{1 \leq i \leq m}$  and  $Y_{[m]} = (Y_i)_{1 \leq i \leq m}$  are tuples of random variables, with the  $X_i$  being  $G$ -valued (but the  $Y_i$  need not be), then we define*

$$D[X_{[m]}|Y_{[m]}] := \mathbb{H}\left[\sum_{i=1}^m \tilde{X}_i | (\tilde{Y}_j)_{1 \leq j \leq m}\right] - \frac{1}{m} \sum_{i=1}^m \mathbb{H}[\tilde{X}_i | \tilde{Y}_i] \quad (12.2)$$

where  $(\tilde{X}_i, \tilde{Y}_i)$ ,  $1 \leq i \leq m$  are independent copies of  $(X_i, Y_i)$ ,  $1 \leq i \leq m$  (but note here that we do not assume  $X_i$  are independent of  $Y_i$ , or  $\tilde{X}_i$  independent of  $\tilde{Y}_i$ ).

**Lemma 12.29** (Alternate form of conditional multidistance). *With the above notation, we have*

$$D[X_{[m]}|Y_{[m]}] = \sum_{(y_i)_{1 \leq i \leq m}} \left( \prod_{1 \leq i \leq m} p_{Y_i}(y_i) \right) D[(X_i | Y_i = y_i)_{1 \leq i \leq m}] \quad (12.3)$$

where each  $y_i$  ranges over the support of  $p_{Y_i}$  for  $1 \leq i \leq m$ .

*Proof.* This is routine from Definition 2.11 and Definitions 12.12 and 12.28.  $\square$

**Lemma 12.30** (Lower bound on conditional multidistance). *If  $(X_i)_{1 \leq i \leq m}$  is a  $\tau$ -minimizer, and  $k := D[(X_i)_{1 \leq i \leq m}]$ , then for any other tuples  $(X'_i)_{1 \leq i \leq m}$  and  $(Y_i)_{1 \leq i \leq m}$  with the  $X'_i$   $G$ -valued, one has*

$$k - D[(X'_i)_{1 \leq i \leq m} | (Y_i)_{1 \leq i \leq m}] \leq \eta \sum_{i=1}^m d[X_i; X'_i | Y_i].$$

*Proof.* Immediate from Lemma 12.27, Lemma 12.29, and Definition 3.19.  $\square$

**Corollary 12.31** (Lower bound on conditional multidistance, II). *With the notation of the previous lemma, we have*

$$k - D[X'_{[m]} | Y_{[m]}] \leq \eta \sum_{i=1}^m d[X_{\sigma(i)}; X'_i | Y_i] \quad (12.4)$$

for any permutation  $\sigma : \{1, \dots, m\} \rightarrow \{1, \dots, m\}$ .

*Proof.* This follows from Lemma 12.30 and Lemma 12.16.  $\square$

## 12.5 The multidistance chain rule

**Lemma 12.32** (Multidistance chain rule). *Let  $\pi : G \rightarrow H$  be a homomorphism of abelian groups and let  $X_{[m]}$  be a tuple of jointly independent  $G$ -valued random variables. Then  $D[X_{[m]}]$  is equal to*

$$D[X_{[m]} | \pi(X_{[m]})] + D[\pi(X_{[m]})] + \mathbb{H}\left[\sum_{i=1}^m X_i : \pi(X_{[m]}) \mid \pi\left(\sum_{i=1}^m X_i\right)\right] \quad (12.5)$$

where  $\pi(X_{[m]}) := (\pi(X_i))_{1 \leq i \leq m}$ .

*Proof.* For notational brevity during this proof, write  $S := \sum_{i=1}^m X_i$ .

From Lemma 2.26 and Lemma 2.2, noting that  $\pi(S)$  is determined both by  $S$  and by  $\pi(X_{[m]})$ , we have

$$\mathbb{H}[S : \pi(X_{[m]}) | \pi(S)] = \mathbb{H}[S] + \mathbb{H}[\pi(X_{[m]})] - \mathbb{H}[S, \pi(X_{[m]})] - \mathbb{H}[\pi(S)],$$

and by Lemma 2.13 the right-hand side is equal to

$$\mathbb{H}[S] - \mathbb{H}[S | \pi(X_{[m]})] - \mathbb{H}[\pi(S)].$$

Therefore,

$$\mathbb{H}[S] = \mathbb{H}[S | \pi(X_{[m]})] + \mathbb{H}[\pi(S)] + \mathbb{H}[S : \pi(X_{[m]}) | \pi(S)]. \quad (12.6)$$

From a further application of Lemma 2.13 and Lemma 2.2 we have

$$\mathbb{H}[X_i] = \mathbb{H}[X_i | \pi(X_i)] + \mathbb{H}[\pi(X_i)] \quad (12.7)$$

for all  $1 \leq i \leq m$ . Averaging (12.7) in  $i$  and subtracting this from (12.6), we obtain the claim from Definition 12.12.  $\square$

We will need to iterate the multidistance chain rule, so it is convenient to observe a conditional version of this rule, as follows.

**Lemma 12.33** (Conditional multidistance chain rule). *Let  $\pi : G \rightarrow H$  be a homomorphism of abelian groups. Let  $I$  be a finite index set and let  $X_{[m]}$  be a tuple of  $G$ -valued random variables. Let  $Y_{[m]}$  be another tuple of random variables (not necessarily  $G$ -valued). Suppose that the pairs  $(X_i, Y_i)$  are jointly independent of one another (but  $X_i$  need not be independent of  $Y_i$ ). Then*

$$D[X_{[m]}|Y_{[m]}] = D[X_{[m]} | \pi(X_{[m]}), Y_{[m]}] + D[\pi(X_{[m]}) | Y_{[m]}] \\ + \mathbb{I}[\sum_{i=1}^m X_i : \pi(X_{[m]}) | \pi(\sum_{i=1}^m X_i), Y_{[m]}]. \quad (12.8)$$

*Proof.* For each  $y_i$  in the support of  $p_{Y_i}$ , apply Lemma 12.32 with  $X_i$  replaced by the conditioned random variable  $(X_i|Y_i = y_i)$ , and the claim (12.8) follows by averaging (12.5) in the  $y_i$  using the weights  $p_{Y_i}$ .  $\square$

We can iterate the above lemma as follows.

**Lemma 12.34.** *Let  $m$  be a positive integer. Suppose one has a sequence*

$$G_m \rightarrow G_{m-1} \rightarrow \dots \rightarrow G_1 \rightarrow G_0 = \{0\} \quad (12.9)$$

*of homomorphisms between abelian groups  $G_0, \dots, G_m$ , and for each  $d = 0, \dots, m$ , let  $\pi_d : G_m \rightarrow G_d$  be the homomorphism from  $G_m$  to  $G_d$  arising from this sequence by composition (so for instance  $\pi_m$  is the identity homomorphism and  $\pi_0$  is the zero homomorphism). Let  $X_{[m]} = (X_i)_{1 \leq i \leq m}$  be a jointly independent tuple of  $G_m$ -valued random variables. Then*

$$D[X_{[m]}] = \sum_{d=1}^m D[\pi_d(X_{[m]}) | \pi_{d-1}(X_{[m]})] \\ + \sum_{d=1}^{m-1} \mathbb{I}[\sum_i X_i : \pi_d(X_{[m]}) | \pi_d(\sum_i X_i), \pi_{d-1}(X_{[m]})]. \quad (12.10)$$

*In particular, by Lemma 2.27,*

$$D[X_{[m]}] \geq \sum_{d=1}^m D[\pi_d(X_{[m]}) | \pi_{d-1}(X_{[m]})] \\ + \mathbb{I}[\sum_i X_i : \pi_1(X_{[m]}) | \pi_1(\sum_i X_i)]. \quad (12.11)$$

*Proof.* From Lemma 12.33 (taking  $Y_{[m]} = \pi_{d-1}(X_{[m]})$  and  $\pi = \pi_d$  there, and noting that  $\pi_d(X_{[m]})$  determines  $Y_{[m]}$ ) we have

$$D[X_{[m]} | \pi_{d-1}(X_{[m]})] = D[X_{[m]} | \pi_d(X_{[m]})] + D[\pi_d(X_{[m]}) | \pi_{d-1}(X_{[m]})] \\ + \mathbb{I}[\sum_{i=1}^m X_i : \pi_d(X_{[m]}) | \pi_d(\sum_{i=1}^m X_i), \pi_{d-1}(X_{[m]})]$$

for  $d = 1, \dots, m$ . The claim follows by telescoping series, noting that  $D[X_{[m]} | \pi_0(X_{[m]})] = D[X_{[m]}]$  and that  $\pi_m(X_{[m]}) = X_{[m]}$  (and also  $\pi_m(\sum_i X_i) = \sum_i X_i$ ).  $\square$

In our application we will need the following special case of the above lemma.

**Corollary 12.35.** *Let  $G$  be an abelian group and let  $m \geq 2$ . Suppose that  $X_{i,j}$ ,  $1 \leq i, j \leq m$ , are independent  $G$ -valued random variables. Then*

$$\begin{aligned} & \mathbb{I}\left[\left(\sum_{i=1}^m X_{i,j}\right)_{j=1}^m : \left(\sum_{j=1}^m X_{i,j}\right)_{i=1}^m \mid \sum_{i=1}^m \sum_{j=1}^m X_{i,j}\right] \\ & \leq \sum_{j=1}^{m-1} \left( D[(X_{i,j})_{i=1}^m] - D[(X_{i,j})_{i=1}^m \mid (X_{i,j} + \dots + X_{i,m})_{i=1}^m] \right) \\ & \quad + D[(X_{i,m})_{i=1}^m] - D\left[\left(\sum_{j=1}^m X_{i,j}\right)_{i=1}^m\right], \end{aligned}$$

where all the multidistances here involve the indexing set  $\{1, \dots, m\}$ .

*Proof.* In Lemma 12.34 we take  $G_d := G^d$  with the maps  $\pi_d : G^m \rightarrow G^d$  for  $d = 1, \dots, m$  defined by

$$\pi_d(x_1, \dots, x_m) := (x_1, \dots, x_{d-1}, x_d + \dots + x_m)$$

with  $\pi_0 = 0$ . Since  $\pi_{d-1}(x)$  can be obtained from  $\pi_d(x)$  by applying a homomorphism, we obtain a sequence of the form (12.9).

Now we apply Lemma 12.34 with  $I = \{1, \dots, m\}$  and  $X_i := (X_{i,j})_{j=1}^m$ . Using joint independence and Corollary 2.24, we find that

$$D[X_{[m]}] = \sum_{j=1}^m D[(X_{i,j})_{1 \leq i \leq m}].$$

On the other hand, for  $1 \leq j \leq m-1$ , we see that once  $\pi_j(X_i)$  is fixed,  $\pi_{j+1}(X_i)$  is determined by  $X_{i,j}$  and vice versa, so

$$D[\pi_{j+1}(X_{[m]}) \mid \pi_j(X_{[m]})] = D[(X_{i,j})_{1 \leq i \leq m} \mid \pi_j(X_{[m]})].$$

Since the  $X_{i,j}$  are jointly independent, we may further simplify:

$$D[(X_{i,j})_{1 \leq i \leq m} \mid \pi_j(X_{[m]})] = D[(X_{i,j})_{1 \leq i \leq m} \mid (X_{i,j} + \dots + X_{i,m})_{1 \leq i \leq m}].$$

Putting all this into the conclusion of Lemma 12.34, we obtain

$$\begin{aligned} \sum_{j=1}^m D[(X_{i,j})_{1 \leq i \leq m}] & \geq \sum_{j=1}^{m-1} D[(X_{i,j})_{1 \leq i \leq m} \mid (X_{i,j} + \dots + X_{i,m})_{1 \leq i \leq m}] \\ & \quad + D\left[\left(\sum_{j=1}^m X_{i,j}\right)_{1 \leq i \leq m}\right] \\ & \quad + \mathbb{I}\left[\left(\sum_{i=1}^m X_{i,j}\right)_{j=1}^m : \left(\sum_{j=1}^m X_{i,j}\right)_{i=1}^m \mid \sum_{i=1}^m \sum_{j=1}^m X_{i,j}\right] \end{aligned}$$

and the claim follows by rearranging.  $\square$

## 12.6 Bounding the mutual information

As before,  $G$  is an abelian group, and  $m \geq 2$ . We let  $X_{[m]} = (X_i)_{i=1}^m$  be a  $\tau$ -minimizer.

**Proposition 12.36** (Bounding mutual information). *Suppose that  $X_{i,j}$ ,  $1 \leq i, j \leq m$ , are jointly independent  $G$ -valued random variables, such that for each  $j = 1, \dots, m$ , the random variables  $(X_{i,j})_{i=1}^m$  coincide in distribution with some permutation of  $X_{[m]}$ . Write*

$$\mathcal{J} := \mathbb{I}\left[\left(\sum_{i=1}^m X_{i,j}\right)_{j=1}^m : \left(\sum_{j=1}^m X_{i,j}\right)_{i=1}^m \mid \sum_{i=1}^m \sum_{j=1}^m X_{i,j}\right].$$

Then

$$\mathcal{J} \leq 4m^2\eta k. \quad (12.12)$$

*Proof.* For each  $j \in \{1, \dots, m\}$  we call the tuple  $(X_{i,j})_{i=1}^m$  a *column* and for each  $i \in \{1, \dots, m\}$  we call the tuple  $(X_{i,j})_{j=1}^m$  a *row*. Hence, by hypothesis, each column is a permutation of  $X_{[m]} = (X_i)_{i=1}^m$ .

From Corollary 12.35 we have

$$\mathcal{J} \leq \sum_{j=1}^{m-1} A_j + B, \quad (12.13)$$

where

$$A_j := D[(X_{i,j})_{i=1}^m] - D[(X_{i,j})_{i=1}^m \mid (X_{i,j} + \dots + X_{i,m})_{i=1}^m]$$

and

$$B := D[(X_{i,m})_{i=1}^m] - D\left[\left(\sum_{j=1}^m X_{i,j}\right)_{i=1}^m\right].$$

We first consider the  $A_j$ , for fixed  $j \in \{1, \dots, m-1\}$ . By Lemma 12.16 and our hypothesis on columns, we have

$$D[(X_{i,j})_{i=1}^m] = D[(X_i)_{i=1}^m] = k.$$

Let  $\sigma = \sigma_j: I \rightarrow I$  be a permutation such that  $X_{i,j} = X_{\sigma(i)}$ , and write  $X'_i := X_{i,j}$  and  $Y_i := X_{i,j} + \dots + X_{i,m}$ . Corollary 12.31, we have

$$A_j \leq \eta \sum_{i=1}^m d[X_{i,j}; X_{i,j} \mid X_{i,j} + \dots + X_{i,m}]. \quad (12.14)$$

We similarly consider  $B$ . By Lemma 12.16 applied to the  $m$ -th column,

$$D[(X_{i,m})_{i=1}^m] = D[X_{[m]}] = k.$$

For  $1 \leq i \leq m$ , denote the sum of row  $i$  by

$$V_i := \sum_{j=1}^m X_{i,j};$$

if we apply Corollary 12.31 again, now with  $X_{\sigma(i)} = X_{i,m}$ ,  $X'_i := V_i$ , and with the variable  $Y_i$  being trivial, we obtain

$$B \leq \eta \sum_{i=1}^m d[X_{i,m}; V_i]. \quad (12.15)$$

It remains to bound the distances appearing in (12.14) and (12.15) further using Ruzsa calculus. For  $1 \leq j \leq m-1$  and  $1 \leq i \leq m$ , by Lemma 3.25 we have

$$\begin{aligned} d[X_{i,j}; X_{i,j} \mid X_{i,j} + \dots + X_{i,m}] &\leq d[X_{i,j}; X_{i,j}] \\ &+ \frac{1}{2} (\mathbb{H}[X_{i,j} + \dots + X_{i,m}] - \mathbb{H}[X_{i,j+1} + \dots + X_{i,m}]). \end{aligned}$$

For each  $i$ , summing over  $j = 1, \dots, m-1$  gives

$$\begin{aligned} & \sum_{j=1}^{m-1} d[X_{i,j}; X_{i,j} | X_{i,j} + \dots + X_{i,m}] \\ & \leq \sum_{j=1}^{m-1} d[X_{i,j}; X_{i,j}] + \frac{1}{2}(\mathbb{H}[V_i] - \mathbb{H}[X_{i,m}]). \end{aligned} \quad (12.16)$$

On the other hand, by Lemma 12.8 (since  $X_{i,m}$  appears in the sum  $V_i$ ) we have

$$d[\overline{X_{i,m}}; V_i] \leq d[X_{i,m}; X_{i,m}] + \frac{1}{2}(\mathbb{H}[V_i] - \mathbb{H}[X_{i,m}]). \quad (12.17)$$

Combining (12.13), (12.14) and (12.15) with (12.16) and (12.17) (the latter two summed over  $i$ ), we get

$$\begin{aligned} \frac{1}{\eta} \mathcal{J} & \leq \sum_{i,j=1}^m d[X_{i,j}; X_{i,j}] + \sum_{i=1}^m (\mathbb{H}[V_i] - \mathbb{H}[X_{i,m}]) \\ & = m \sum_{i=1}^m d[X_i; X_i] + \sum_{i=1}^m \mathbb{H}[V_i] - \sum_{i=1}^m \mathbb{H}[X_i]. \end{aligned} \quad (12.18)$$

By Lemma 12.9 (with  $f$  taking each  $j$  to the index  $j'$  such that  $X_{i,j}$  is a copy of  $X_{j'}$ ) we obtain the bound

$$\mathbb{H}[V_i] \leq \mathbb{H}\left[\sum_{j=1}^m X_j\right] + \sum_{j=1}^m d[X_{i,j}; X_{i,j}].$$

Finally, summing over  $i$  and using  $D[X_{[m]}] = k$  gives

$$\begin{aligned} \sum_{i=1}^m \mathbb{H}[V_i] - \sum_{i=1}^m \mathbb{H}[X_i] & \leq \sum_{i,j=1}^m d[X_{i,j}; X_{i,j}] + mk \\ & = m \sum_{i=1}^m d[X_i; X_i] + mk, \end{aligned}$$

where in the second step we used the permutation hypothesis. Combining this with (12.18) gives the

$$\mathcal{J} \leq 2\eta m \left( \sum_{i=1}^m d[X_i; X_i] \right).$$

The claim (12.12) is now immediate from Lemma 12.18.  $\square$

## 12.7 Endgame

Now let  $m \geq 2$ , let  $G$  be an  $m$ -torsion abelian group, and let  $(X_i)_{1 \leq i \leq m}$  be a  $\tau$ -minimizer.

**Definition 12.37** (Additional random variables). *By a slight abuse of notation, we identify  $\mathbb{Z}/m\mathbb{Z}$  and  $\{1, \dots, m\}$  in the obvious way, and let  $Y_{i,j}$  be an independent copy of  $X_i$  for  $i, j \in \mathbb{Z}/m\mathbb{Z}$ . Then also define:*

$$W := \sum_{i,j \in \mathbb{Z}/m\mathbb{Z}} Y_{i,j}$$

and

$$Z_1 := \sum_{i,j \in \mathbb{Z}/m\mathbb{Z}} iY_{i,j}, \quad Z_2 := \sum_{i,j \in \mathbb{Z}/m\mathbb{Z}} jY_{i,j}, \quad Z_3 := \sum_{i,j \in \mathbb{Z}/m\mathbb{Z}} (-i-j)Y_{i,j}.$$

The addition  $(-i-j)$  takes place over  $\mathbb{Z}/m\mathbb{Z}$ . Note that, because we are assuming  $G$  is  $m$ -torsion, it is well-defined to multiply elements of  $G$  by elements of  $\mathbb{Z}/m\mathbb{Z}$ . We will also define for  $i, j, r \in \mathbb{Z}/m\mathbb{Z}$  the variables

$$P_i := \sum_{j \in \mathbb{Z}/m\mathbb{Z}} Y_{i,j}, \quad Q_j := \sum_{i \in \mathbb{Z}/m\mathbb{Z}} Y_{i,j}, \quad R_r := \sum_{\substack{i,j \in \mathbb{Z}/m\mathbb{Z} \\ i+j=-r}} Y_{i,j}. \quad (12.19)$$

**Lemma 12.38** (Zero-sum). *We have*

$$Z_1 + Z_2 + Z_3 = 0 \quad (12.20)$$

*Proof.* Clear from definition.  $\square$

**Proposition 12.39** (Mutual information bound). *We have*

$$\mathbb{I}[Z_1 : Z_2 | W], \mathbb{I}[Z_2 : Z_3 | W], \mathbb{I}[Z_1 : Z_3 | W] \leq t$$

where

$$t := 4m^2\eta k. \quad (12.21)$$

*Proof.* We analyze these variables by Proposition 12.36 in several different ways. In the first application, take  $X_{i,j} = Y_{i,j}$ . Note that each column  $(X_{i,j})_{i=1}^m$  is indeed a permutation of  $X_1, \dots, X_m$ ; in fact, the trivial permutation. Note also that for each  $i \in \mathbb{Z}/m\mathbb{Z}$ , the row sum is

$$\sum_{j=1}^m X_{i,j} = \sum_{j \in \mathbb{Z}/m\mathbb{Z}} Y_{i,j} = P_i$$

and for each  $j \in \mathbb{Z}/m\mathbb{Z}$ , the column sum is

$$\sum_{i=1}^m X_{i,j} = \sum_{i \in \mathbb{Z}/m\mathbb{Z}} Y_{i,j} = Q_j.$$

Finally note that  $\sum_{i,j=1}^m X_{i,j} = W$ . From Proposition 12.36 we then have

$$\mathbb{I}[(P_i)_{i \in \mathbb{Z}/m\mathbb{Z}} : (Q_j)_{j \in \mathbb{Z}/m\mathbb{Z}} | W] \leq t,$$

with  $t$  as in (12.21). Since  $Z_1$  is a function of  $(P_i)_{i \in \mathbb{Z}/m\mathbb{Z}}$  by (12.19), and similarly  $Z_2$  is a function of  $(Q_j)_{j \in \mathbb{Z}/m\mathbb{Z}}$ , it follows immediately from Lemma 12.4 that

$$\mathbb{I}[Z_1 : Z_2 | W] \leq t.$$

In the second application of Proposition 12.36, we instead consider  $X'_{i,j} = Y_{i-j,j}$ . Again, for each fixed  $j$ , the tuple  $(X'_{i,j})_{i=1}^m$  is a permutation of  $X_1, \dots, X_m$ . This time the row sums for  $i \in \{1, \dots, m\}$  are

$$\sum_{j=1}^m X'_{i,j} = \sum_{j \in \mathbb{Z}/m\mathbb{Z}} Y_{i-j,j} = R_{-i}.$$

Similarly, the column sums for  $j \in \{1, \dots, m\}$  are

$$\sum_{i=1}^m X'_{i,j} = \sum_{i \in \mathbb{Z}/m\mathbb{Z}} Y_{i-j,j} = Q_j.$$

As before,  $\sum_{i,j=1}^m X'_{i,j} = W$ . Hence, using (12.19) and Lemma 12.4 again, Proposition 12.36 tells us

$$\mathbb{I}[Z_3 : Z_2 | W] \leq \mathbb{I}[(R_i)_{i \in \mathbb{Z}/m\mathbb{Z}} : (Q_j)_{j \in \mathbb{Z}/m\mathbb{Z}} | W] \leq t.$$

In the third application<sup>1</sup> of Proposition 12.36, take  $X''_{i,j} = Y_{i,j-i}$ . The column and row sums are respectively

$$\sum_{j=1}^m X''_{i,j} = \sum_{j \in \mathbb{Z}/m\mathbb{Z}} Y_{i,j-i} = P_i$$

and

$$\sum_{i=1}^m X''_{i,j} = \sum_{i \in \mathbb{Z}/m\mathbb{Z}} Y_{i,j-i} = R_{-j}.$$

Hence, Proposition 12.36 and Lemma 12.4 give

$$\mathbb{I}[Z_1 : Z_3 | W] \leq \mathbb{I}[(P_i)_{i \in \mathbb{Z}/m\mathbb{Z}} : (R_j)_{j \in \mathbb{Z}/m\mathbb{Z}} | W] \leq t,$$

which completes the proof.  $\square$

**Lemma 12.40** (Entropy of  $W$ ). *We have  $\mathbb{H}[W] \leq (2m-1)k + \frac{1}{m} \sum_{i=1}^m \mathbb{H}[X_i]$ .*

*Proof.* Without loss of generality, we may take  $X_1, \dots, X_m$  to be independent. Write  $S = \sum_{i=1}^m X_i$ . Note that for each  $j \in \mathbb{Z}/m\mathbb{Z}$ , the sum  $Q_j$  from (12.19) above has the same distribution as  $S$ . By Lemma 12.6 we have

$$\begin{aligned} \mathbb{H}[W] &= \mathbb{H}\left[\sum_{j \in \mathbb{Z}/m\mathbb{Z}} Q_j\right] \leq \mathbb{H}[S] + \sum_{j=2}^m (\mathbb{H}[Q_1 + Q_j] - \mathbb{H}[S]) \\ &= \mathbb{H}[S] + (m-1)d[S; -S]. \end{aligned}$$

By Lemma 12.20, we have

$$d[S; -S] \leq 2k \tag{12.22}$$

and hence

$$\mathbb{H}[W] \leq 2k(m-1) + \mathbb{H}[S].$$

From Definition 12.12 we have

$$\mathbb{H}[S] = k + \frac{1}{m} \sum_{i=1}^m \mathbb{H}[X_i], \tag{12.23}$$

and the claim follows.  $\square$

**Lemma 12.41** (Entropy of  $Z_2$ ). *We have  $\mathbb{H}[Z_2] \leq (8m^2 - 16m + 1)k + \frac{1}{m} \sum_{i=1}^m \mathbb{H}[X_i]$ .*

<sup>1</sup>In fact, by permuting the variables  $(Y_{i,j})_{i,j \in \mathbb{Z}/m\mathbb{Z}}$ , one can see that the random variables  $(W, Z_1, Z_2)$  and  $(W, Z_1, Z_3)$  have the same distribution, so this is in some sense identical to – and can be deduced from – the first application.

*Proof.* We observe

$$\mathbb{H}[Z_2] = \mathbb{H}\left[\sum_{j \in \mathbb{Z}/m\mathbb{Z}} jQ_j\right].$$

Applying Lemma 12.6 one has

$$\mathbb{H}[Z_2] \leq \sum_{i=2}^{m-1} \mathbb{H}[Q_1 + iQ_i] - (m-2)\mathbb{H}[S].$$

Using Lemma 12.11 and (12.22) we get

$$\begin{aligned} \mathbb{H}[Z_2] &\leq \mathbb{H}[S] + 4m(m-2)d[S; -S] \\ &\leq \mathbb{H}[S] + 8m(m-2)k. \end{aligned}$$

Applying (12.23) gives the claim.  $\square$

**Lemma 12.42** (Mutual information bound). *We have  $\mathbb{I}[W : Z_2] \leq 2(m-1)k$ .*

*Proof.* From Lemma 2.16 we have  $\mathbb{I}[W : Z_2] = \mathbb{H}[W] - \mathbb{H}[W|Z_2]$ , and since  $Z_2 = \sum_{j=1}^{m-1} jQ_j$  and  $W = \sum_{j=1}^m Q_j$ ,

$$\mathbb{H}[W|Z_2] \geq \mathbb{H}[W | Q_1, \dots, Q_{m-1}] = \mathbb{H}[Q_m] = \mathbb{H}[S].$$

Hence, by Lemma 12.40,

$$\mathbb{I}[W : Z_2] \leq \mathbb{H}[W] - \mathbb{H}[S] \leq 2(m-1)k,$$

as claimed.  $\square$

**Lemma 12.43** (Distance bound). *We have  $\sum_{i=1}^m d[X_i; Z_2|W] \leq 8(m^3 - m^2)k$ .*

*Proof.* For each  $i \in \{1, \dots, m\}$ , using Lemma 12.8 (noting the sum  $Z_2$  contains  $X_i$  as a summand) we have

$$d[X_i; Z_2] \leq d[X_i; X_i] + \frac{1}{2}(\mathbb{H}[Z_2] - \mathbb{H}[X_i]) \quad (12.24)$$

and using Lemma 3.24 we have

$$d[X_i; Z_2|W] \leq d[X_i; Z_2] + \frac{1}{2}\mathbb{I}[W : Z_2].$$

Combining with (12.24) and Lemma 12.42 gives

$$d[X_i; Z_2|W] \leq d[X_i; X_i] + \frac{1}{2}(\mathbb{H}[Z_2] - \mathbb{H}[X_i]) + (m-1)k.$$

Summing over  $i$  and applying Lemma 12.41 gives

$$\sum_{i=1}^m d[X_i; Z_2|W] \leq \sum_{i=1}^m d[X_i; X_i] + m(8m^2 - 16m + 1)k + m(m-1)k.$$

Finally, applying Lemma 12.18 (and dropping some lower order terms) gives the claim.  $\square$

**Lemma 12.44** (Application of BSG). *Let  $G$  be an abelian group, let  $(T_1, T_2, T_3)$  be a  $G^3$ -valued random variable such that  $T_1 + T_2 + T_3 = 0$  holds identically, and write*

$$\delta := \mathbb{I}[T_1 : T_2] + \mathbb{I}[T_1 : T_3] + \mathbb{I}[T_2 : T_3].$$

*Let  $Y_1, \dots, Y_n$  be some further  $G$ -valued random variables and let  $\alpha > 0$  be a constant. Then there exists a random variable  $U$  such that*

$$d[U; U] + \alpha \sum_{i=1}^n d[Y_i; U] \leq \left(2 + \frac{\alpha n}{2}\right) \delta + \alpha \sum_{i=1}^n d[Y_i; T_2]. \quad (12.25)$$

*Proof.* We apply Lemma 3.23 with  $X = T_1$  and  $Y = T_2$ . Since  $T_1 + T_2 = -T_3$ , we find that

$$\begin{aligned} \sum_z p_{T_3}(z) d[T_1 | T_3 = z; T_2 | T_3 = z] \\ \leq 3\mathbb{I}[T_1 : T_2] + 2\mathbb{H}[T_3] - \mathbb{H}[T_1] - \mathbb{H}[T_2] \\ = \mathbb{I}[T_1 : T_2] + \mathbb{I}[T_1 : T_3] + \mathbb{I}[T_2 : T_3] = \delta, \end{aligned} \quad (12.26)$$

where the last line follows from Lemma 2.2 by observing

$$\mathbb{H}[T_1, T_2] = \mathbb{H}[T_1, T_3] = \mathbb{H}[T_2, T_3] = \mathbb{H}[T_1, T_2, T_3]$$

since any two of  $T_1, T_2, T_3$  determine the third.

By (12.26) and the triangle inequality,

$$\sum_z p_{T_3}(z) d[T_2 | T_3 = z; T_2 | T_3 = z] \leq 2\delta$$

and by Lemma 3.25, for each  $Y_i$ ,

$$\begin{aligned} \sum_z p_{T_3}(z) d[Y_i; T_2 | T_3 = z] \\ = d[Y_i; T_2 | T_3] \leq d[Y_i; T_2] + \frac{1}{2} \mathbb{I}[T_2 : T_3] \leq d[Y_i; T_2] + \frac{\delta}{2}. \end{aligned}$$

Hence,

$$\begin{aligned} \sum_z p_{T_3}(z) \left( d[T_2 | T_3 = z; T_2 | T_3 = z] + \alpha \sum_{i=1}^n d[Y_i; T_2 | T_3 = z] \right) \\ \leq \left(2 + \frac{\alpha n}{2}\right) \delta + \alpha \sum_{i=1}^n d[Y_i; T_2], \end{aligned}$$

and the result follows by setting  $U = (T_2 | T_3 = z)$  for some  $z$  such that the quantity in parentheses on the left-hand side is at most the weighted average value.  $\square$

**Proposition 12.45** (Vanishing entropy). *We have  $k = 0$ .*

*Proof.* For each value  $W = w$ , apply Lemma 12.44 (and Lemma 12.38) to

$$T_1 = (Z_1 | W = w), \quad T_2 = (Z_2 | W = w), \quad T_3 = (Z_3 | W = w)$$

with  $Y_i = X_i$  and  $\alpha = \eta/m$ . Write

$$\delta_w := \mathbb{I}[T_1 : T_2] + \mathbb{I}[T_1 : T_3] + \mathbb{I}[T_2 : T_3]$$

for this choice, and note that

$$\begin{aligned}\delta_* &:= \sum_w p_W(w) \delta_w = \mathbb{I}[Z_1 : Z_2 | W] + \mathbb{I}[Z_1 : Z_3 | W] + \mathbb{I}[Z_2 : Z_3 | W] \\ &\leq 12m^2 \eta k\end{aligned}\tag{12.27}$$

by Proposition 12.39. Write  $U_w$  for the random variable guaranteed to exist by Lemma 12.44, so that (12.25) gives

$$d[U_w; U_w] \leq \left(2 + \frac{\alpha m}{2}\right) \delta_w + \alpha \sum_{i=1}^m (d[X_i; T_2] - d[X_i; U_w]).\tag{12.28}$$

Let  $(U_w)_I$  denote the tuple consisting of the same variable  $U_w$  repeated  $m$  times. By Lemma 12.19

$$D[(U_w)_I] \leq m d[U_w; U_w].\tag{12.29}$$

On the other hand, from Lemma 12.27 one has

$$D[(U_w)_I] \geq k - \eta \sum_{i=1}^m d[X_i; U_w].\tag{12.30}$$

Combining (12.28), (12.29) and (12.30) and averaging over  $w$  (with weight  $p_W(w)$ ), and recalling the value  $\alpha = \eta/m$ , gives

$$m \left(2 + \frac{\eta}{2}\right) \delta_* + \eta \sum_{i=1}^m d[X_i; Z_2 | W] \geq k$$

since the terms  $d[X_i; U_w]$  cancel by our choice of  $\alpha$ . Substituting in Lemma 12.43 and (12.27), and using the fact that  $2 + \frac{\eta}{2} < 3$ , we have

$$12m^3 \left(2 + \frac{\eta}{2}\right) \eta k + \eta 8(m^3 - m^2) k \geq k.$$

From Definition 12.22 we have we have

$$12m^3 \left(2 + \frac{\eta}{2}\right) \eta + \eta 8(m^3 - m^2) < 1$$

and hence  $k \leq 0$ . The claim now follows from Lemma 12.15.  $\square$

## 12.8 Wrapping up

**Theorem 12.46** (Entropy form of PFR). *Suppose that  $G$  is a finite abelian group of torsion  $m$ . Suppose that  $X$  is a  $G$ -valued random variable. Then there exists a subgroup  $H \leq G$  such that*

$$d[X; U_H] \leq 64m^3 d[X; X].$$

*Proof.* Set  $X^0 := X$ . By Proposition 12.25, there exists a  $\tau$ -minimizer  $X_{[m]} = (X_i)_{1 \leq i \leq m}$ . By Proposition 12.45, we have  $D[X_{[m]}] = 0$ . By Proposition 12.26 and the pigeonhole principle, there exists  $1 \leq i \leq m$  such that  $d[X_i; X] \leq \frac{2}{\eta} d[X; X]$ . By Proposition 12.21, we have  $d[X_i; U_H] = 0$  for some subgroup  $H \leq G$ , hence by Lemma 3.18 we have  $d[U_H; X] \leq \frac{2}{\eta} d[X; X]$ . The claim then follows from Definition 12.22.  $\square$

**Lemma 12.47.** *Suppose that  $G$  is a finite abelian group of torsion  $m$ . If  $A \subset G$  is non-empty and  $|A + A| \leq K|A|$ , then  $A$  can be covered by at most  $K^{(64m^3+2)/2}|A|^{1/2}/|H|^{1/2}$  translates of a subspace  $H$  of  $G$  with*

$$|H|/|A| \in [K^{-64m^3}, K^{64m^3}]. \quad (12.31)$$

*Proof.* Repeat the proof of Lemma 7.2, but with Theorem 12.46 in place of Theorem 6.24.  $\square$

**Theorem 12.48** (PFR). *Suppose that  $G$  is a finite abelian group of torsion  $m$ . If  $A \subset G$  is non-empty and  $|A + A| \leq K|A|$ , then  $A$  can be covered by most  $mK^{64m^3+1}$  translates of a subspace  $H$  of  $G$  with  $|H| \leq |A|$ .*

*Proof.* Repeat the proof of Theorem 7.3, but with Lemma 12.47 in place of Lemma 7.2.  $\square$

# Chapter 13

## Further improvement to exponent

### 13.1 Kullback–Leibler divergence

In the definitions below,  $G$  is a set.

**Definition 13.1** (Kullback–Leibler divergence). *If  $X, Y$  are two  $G$ -valued random variables, the Kullback–Leibler divergence is defined as*

$$D_{KL}(X\|Y) := \sum_x \mathbf{P}(X = x) \log \frac{\mathbf{P}(X = x)}{\mathbf{P}(Y = x)}.$$

**Lemma 13.2** (Kullback–Leibler divergence of copy). *If  $X'$  is a copy of  $X$ , and  $Y'$  is a copy of  $Y$ , then  $D_{KL}(X'\|Y') = D_{KL}(X\|Y)$ .*

*Proof.* Clear from definition. □

**Lemma 13.3** (Gibbs inequality).  $D_{KL}(X\|Y) \geq 0$ .

*Proof.* Apply Lemma 1.4 on the definition. □

**Lemma 13.4** (Converse Gibbs inequality). *If  $D_{KL}(X\|Y) = 0$ , then  $Y$  is a copy of  $X$ .*

*Proof.* Apply Lemma 1.5. □

**Lemma 13.5** (Convexity of Kullback–Leibler). *If  $S$  is a finite set,  $\sum_{s \in S} w_s = 1$  for some non-negative  $w_s$ , and  $\mathbf{P}(X = x) = \sum_{s \in S} w_s \mathbf{P}(X_s = x)$ ,  $\mathbf{P}(Y = x) = \sum_{s \in S} w_s \mathbf{P}(Y_s = x)$  for all  $x$ , then*

$$D_{KL}(X\|Y) \leq \sum_{s \in S} w_s D_{KL}(X_s\|Y_s).$$

*Proof.* For each  $x$ , replace  $\log \frac{\mathbf{P}(X_s=x)}{\mathbf{P}(Y_s=x)}$  in the definition with  $\log \frac{w_s \mathbf{P}(X_s=x)}{w_s \mathbf{P}(Y_s=x)}$  for each  $s$ , and apply Lemma 1.4. □

**Lemma 13.6** (Kullback–Leibler and injections). *If  $f : G \rightarrow H$  is an injection, then  $D_{KL}(f(X)\|f(Y)) = D_{KL}(X\|Y)$ .*

*Proof.* Clear from definition. □

Now let  $G$  be an additive group.

**Lemma 13.7** (Kullback–Leibler and sums). *If  $X, Y, Z$  are independent  $G$ -valued random variables, then*

$$D_{KL}(X + Z \| Y + Z) \leq D_{KL}(X \| Y).$$

*Proof.* For each  $z$ ,  $D_{KL}(X + z \| Y + z) = D_{KL}(X \| Y)$  by Lemma 13.6. Then apply Lemma 13.5 with  $w_z = \mathbf{P}(Z = z)$ .  $\square$

**Definition 13.8** (Conditional Kullback–Leibler divergence). *If  $X, Y, Z$  are random variables, with  $X, Z$  defined on the same sample space, we define*

$$D_{KL}(X|Z \| Y) := \sum_z \mathbf{P}(Z = z) D_{KL}((X|Z = z) \| Y).$$

**Lemma 13.9** (Kullback–Leibler and conditioning). *If  $X, Y$  are independent  $G$ -valued random variables, and  $Z$  is another random variable defined on the same sample space as  $X$ , then*

$$D_{KL}((X|Z) \| Y) = D_{KL}(X \| Y) + \mathbb{H}[X] - \mathbb{H}[X|Z].$$

*Proof.* Compare the terms correspond to each  $x \in G$  on both sides.  $\square$

**Lemma 13.10** (Conditional Gibbs inequality).  $D_{KL}((X|W) \| Y) \geq 0$ .

*Proof.* Clear from Definition 13.8 and Lemma 13.3.  $\square$

## 13.2 Rho functionals

Let  $G$  be an additive group, and let  $A$  be a non-empty subset of  $G$ .

**Definition 13.11** (Rho minus). *For any  $G$ -valued random variable  $X$ , we define  $\rho^-(X)$  to be the infimum of  $D_{KL}(X \| U_A + T)$ , where  $U_A$  is uniform on  $A$  and  $T$  ranges over  $G$ -valued random variables independent of  $U_A$ .*

**Definition 13.12** (Rho plus). *For any  $G$ -valued random variable  $X$ , we define  $\rho^+(X) := \rho^-(X) + \mathbb{H}(X) - \mathbb{H}(U_A)$ .*

**Lemma 13.13** (Rho minus non-negative). *We have  $\rho^-(X) \geq 0$ .*

*Proof.* Clear from Lemma 13.10.  $\square$

**Lemma 13.14** (Rho minus of subgroup). *If  $H$  is a finite subgroup of  $G$ , then  $\rho^-(U_H) = \log |A| - \log \max_t |A \cap (H + t)|$ .*

*Proof.* For every  $G$ -valued random variable  $T$  that is independent of  $Y$ ,

$$D_{KL}(U_H \| U_A + T) = \sum_{h \in H} \frac{1}{|H|} \log \frac{1/|H|}{\mathbf{P}[U_A + T = h]} \geq -\log(\mathbf{P}[U_A + T \in H]),$$

by Lemma 1.4. Then observe that

$$-\log(\mathbf{P}[U_A + T \in H]) = -\log(\mathbf{P}[U_A \in H - T]) \geq -\log(\max_{t \in G} \mathbf{P}[U_A \in H + t]).$$

This proves  $\geq$ .

To get the equality, let  $t^* := \arg \max_t |A \cap (H + t)|$  and observe that

$$\rho^-(U_H) \leq D_{KL}(U_H \| U_A + (U_H - t^*)) = \log |A| - \log \max_t |A \cap (H + t)|.$$

$\square$

**Corollary 13.15** (Rho plus of subgroup). *If  $H$  is a finite subgroup of  $G$ , then  $\rho^+(U_H) = \log |H| - \log \max_t |A \cap (H + t)|$ .*

*Proof.* Straightforward by definition and Lemma 13.14. □

**Definition 13.16** (Rho functional). *We define  $\rho(X) := (\rho^+(X) + \rho^-(X))/2$ .*

**Lemma 13.17.** *We have  $\rho(U_A) = 0$ .*

*Proof.*  $\rho^-(U_A) \leq 0$  by the choice  $T = 0$ . The claim then follows from Lemma 13.13. □

**Lemma 13.18** (Rho of subgroup). *If  $H$  is a finite subgroup of  $G$ , and  $\rho(U_H) \leq r$ , then there exists  $t$  such that  $|A \cap (H + t)| \geq 2^{-r} \sqrt{|A||H|}$ , and  $|H|/|A| \in [2^{-2r}, 2^{2r}]$ .*

*Proof.* The first claim is a direct corollary of Lemma 13.14 and Corollary 13.15. To see the second claim, observe that Lemma 13.13 and Corollary 13.15 imply  $\rho^-(U_H), \rho^+(U_H) \geq 0$ . Therefore

$$|H(U_A) - H(U_H)| = |\rho^+(U_H) - \rho^-(U_H)| \leq \rho^-(U_H) + \rho^+(U_H) = 2\rho(U_H) \leq 2r,$$

which implies the second claim. □

**Lemma 13.19** (Rho invariant). *For any  $s \in G$ ,  $\rho(X + s) = \rho(X)$ .*

*Proof.* Observe that by Lemma 13.6,

$$\inf_T D_{KL}(X \| U_A + T) = \inf_T D_{KL}(X + s \| U_A + T + s) = \inf_{T'} D_{KL}(X + s \| U_A + T').$$

□

**Lemma 13.20** (Rho continuous).  *$\rho(X)$  depends continuously on the distribution of  $X$ .*

*Proof.* Clear from definition. □

**Lemma 13.21** (Rho and sums). *If  $X, Y$  are independent, one has*

$$\rho^-(X + Y) \leq \rho^-(X)$$

$$\rho^+(X + Y) \leq \rho^+(X) + \mathbb{H}[X + Y] - \mathbb{H}[X]$$

and

$$\rho(X + Y) \leq \rho(X) + \frac{1}{2}(\mathbb{H}[X + Y] - \mathbb{H}[X]).$$

*Proof.* The first inequality follows from Lemma 13.7. The second and third inequalities are direct corollaries of the first. □

**Definition 13.22** (Conditional Rho functional). *We define  $\rho(X|Y) := \sum_y \mathbf{P}(Y = y) \rho(X|Y = y)$ .*

**Lemma 13.23.** *For any  $s \in G$ ,  $\rho(X + s|Y) = \rho(X|Y)$ .*

*Proof.* Direct corollary of Lemma 13.19. □

**Lemma 13.24.** *If  $f$  is injective, then  $\rho(X|f(Y)) = \rho(X|Y)$ .*

*Proof.* Clear from the definition. □

**Lemma 13.25** (Rho and conditioning). *If  $X, Z$  are defined on the same space, one has*

$$\rho^-(X|Z) \leq \rho^-(X) + \mathbb{H}[X] - \mathbb{H}[X|Z]$$

$$\rho^+(X|Z) \leq \rho^+(X)$$

and

$$\rho(X|Z) \leq \rho(X) + \frac{1}{2}(\mathbb{H}[X] - \mathbb{H}[X|Z]).$$

*Proof.* The first inequality follows from Lemma 13.9. The second and third inequalities are direct corollaries of the first.  $\square$

The following lemmas hold for  $G = \mathbb{F}_2^n$ .

**Lemma 13.26** (Rho and sums, symmetrized). *If  $X, Y$  are independent, then*

$$\rho(X + Y) \leq \frac{1}{2}(\rho(X) + \rho(Y) + d[X; Y]).$$

*Proof.* Apply Lemma 13.21 for  $(X, Y)$  and  $(Y, X)$  and take their average.  $\square$

**Lemma 13.27** (Rho and conditioning, symmetrized). *If  $X, Y$  are independent, then*

$$\rho(X|X + Y) \leq \frac{1}{2}(\rho(X) + \rho(Y) + d[X; Y]).$$

*Proof.* First apply Lemma 13.25 to get  $\rho(X|X + Y) \leq \rho(X) + \frac{1}{2}(\mathbb{H}[X + Y] - \mathbb{H}[Y])$ , and  $\rho(Y|X + Y) \leq \rho(Y) + \frac{1}{2}(\mathbb{H}[X + Y] - \mathbb{H}[X])$ . Then apply Lemma 13.19 to get  $\rho(Y|X + Y) = \rho(X|X + Y)$  and take the average of the two inequalities.  $\square$

### 13.3 Studying a minimizer

Set  $\eta < 1/8$ . In this section, consider  $G = \mathbb{F}_2^n$ .

**Definition 13.28.** *Given  $G$ -valued random variables  $X, Y$ , define*

$$\phi[X; Y] := d[X; Y] + \eta(\rho(X) + \rho(Y))$$

and define a  $\phi$ -minimizer to be a pair of random variables  $X, Y$  which minimizes  $\phi[X; Y]$ .

**Lemma 13.29** ( $\phi$ -minimizers exist). *There exists a  $\phi$ -minimizer.*

*Proof.* Clear from compactness.  $\square$

Let  $(X_1, X_2)$  be a  $\phi$ -minimizer, and  $\tilde{X}_1, \tilde{X}_2$  be independent copies of  $X_1, X_2$  respectively. Similar to the original proof we define

$$I_1 := I[X_1 + X_2 : \tilde{X}_1 + X_2 | X_1 + X_2 + \tilde{X}_1 + \tilde{X}_2], I_2 := \mathbb{I}[X_1 + X_2 : X_1 + \tilde{X}_1 | X_1 + X_2 + \tilde{X}_1 + \tilde{X}_2].$$

First we need the  $\phi$ -minimizer variants of Lemma 6.12 and Lemma 6.16.

**Lemma 13.30.**  $I_1 \leq 2\eta d[X_1; X_2]$

*Proof.* Similar to Lemma 6.12: get upper bounds for  $d[X_1; X_2]$  by  $\phi[X_1; X_2] \leq \phi[X_1 + X_2; \tilde{X}_1 + \tilde{X}_2]$  and  $\phi[X_1; X_2] \leq \phi[X_1 | X_1 + X_2; \tilde{X}_2 | \tilde{X}_1 + \tilde{X}_2]$ , and then apply Lemma 6.8 to get an upper bound for  $I_1$ .  $\square$

**Lemma 13.31.**  $d[X_1; X_1] + d[X_2; X_2] = 2d[X_1; X_2] + (I_2 - I_1)$ .

*Proof.* Compare Lemma 6.8 with the identity obtained from applying Corollary 5.3 on  $(X_1, \tilde{X}_1, X_2, \tilde{X}_2)$ .  $\square$

**Lemma 13.32.**  $I_2 \leq 2\eta d[X_1; X_2] + \frac{\eta}{1-\eta}(2\eta d[X_1; X_2] - I_1)$ .

*Proof.* First of all, by  $\phi[X_1; X_2] \leq \phi[X_1 + \tilde{X}_1; X_2 + \tilde{X}_2]$ ,  $\phi[X_1; X_2] \leq \phi[X_1|X_1 + \tilde{X}_1; X_2|X_2 + \tilde{X}_2]$ , and the fibring identity obtained by applying Corollary 5.3 on  $(X_1, X_2, \tilde{X}_1, \tilde{X}_2)$ , we have  $I_2 \leq \eta(d[X_1; X_2] + d[X_2; X_2])$ . Then apply Lemma 13.31 to get  $I_2 \leq 2\eta d[X_1; X_2] + \eta(I_2 - I_1)$ , and rearrange.  $\square$

Next we need some inequalities for the endgame.

**Lemma 13.33.** *If  $G$ -valued random variables  $T_1, T_2, T_3$  satisfy  $T_1 + T_2 + T_3 = 0$ , then*

$$d[X_1; X_2] \leq 3\mathbb{I}[T_1 : T_2 | T_3] + (2\mathbb{H}[T_3] - \mathbb{H}[T_1] - \mathbb{H}[T_2]) + \eta(\rho(T_1|T_3) + \rho(T_2|T_3) - \rho(X_1) - \rho(X_2)).$$

*Proof.* Conditioned on every  $T_3 = t$ ,  $d[X_1; X_2] \leq d[T_1|T_3 = t; T_2|T_3 = t] + \eta(\rho(T_1|T_3 = t) + \rho(T_2|T_3 = t) - \rho(X_1) - \rho(X_2))$  by Definition 13.28. Then take the weighted average with weight  $\mathbf{P}(T_3 = t)$  and then apply Lemma 3.23 to bound the RHS.  $\square$

**Lemma 13.34.** *If  $G$ -valued random variables  $T_1, T_2, T_3$  satisfy  $T_1 + T_2 + T_3 = 0$ , then*

$$d[X_1; X_2] \leq \sum_{1 \leq i < j \leq 3} \mathbb{I}[T_i : T_j] + \frac{\eta}{3} \sum_{1 \leq i < j \leq 3} (\rho(T_i|T_j) + \rho(T_j|T_i) - \rho(X_1) - \rho(X_2))$$

*Proof.* Take the average of Lemma 13.33 over all 6 permutations of  $T_1, T_2, T_3$ .  $\square$

**Lemma 13.35.** *For independent random variables  $Y_1, Y_2, Y_3, Y_4$  over  $G$ , define  $S := Y_1 + Y_2 + Y_3 + Y_4$ ,  $T_1 := Y_1 + Y_2$ ,  $T_2 := Y_1 + Y_3$ . Then*

$$\rho(T_1|T_2, S) + \rho(T_2|T_1, S) - \frac{1}{2} \sum_i \rho(Y_i) \leq \frac{1}{2}(d[Y_1; Y_2] + d[Y_3; Y_4] + d[Y_1; Y_3] + d[Y_2; Y_4]).$$

*Proof.* Let  $T'_1 := Y_3 + Y_4$ ,  $T'_2 := Y_2 + Y_4$ . First note that

$$\begin{aligned} \rho(T_1|T_2, S) &\leq \rho(T_1|S) + \frac{1}{2}\mathbb{I}(T_1 : T_2 | S) \text{ (by Lemma 13.25)} \\ &\leq \frac{1}{2}(\rho(T_1) + \rho(T'_1)) + \frac{1}{2}(d[T_1; T'_1] + \mathbb{I}(T_1 : T_2 | S)) \text{ (by Lemma 13.27)} \\ &\leq \frac{1}{4} \sum_i \rho(Y_i) + \frac{1}{4}(d[Y_1; Y_2] + d[Y_3; Y_4]) + \frac{1}{2}(d[T_1; T'_1] + \mathbb{I}(T_1 : T_2 | S)). \text{ (by Lemma 13.26)} \end{aligned}$$

On the other hand, observe that

$$\begin{aligned} \rho(T_1|T_2, S) &= \rho(Y_1 + Y_2|T_2, T'_2) \text{ (by Lemma 13.24)} \\ &\leq \frac{1}{2}(\rho(Y_1|T_2) + \rho(Y_2|T'_2)) + \frac{1}{2}(d[Y_1|T_2; Y_2|T'_2]) \text{ (by Lemma 13.26)} \\ &\leq \frac{1}{4} \sum_i \rho(Y_i) + \frac{1}{4}(d[Y_1; Y_3] + d[Y_2; Y_4]) + \frac{1}{2}(d[Y_1|T_2; Y_2|T'_2]). \text{ (by Lemma 13.27).} \end{aligned}$$

By replacing  $(Y_1, Y_2, Y_3, Y_4)$  with  $(Y_1, Y_3, Y_2, Y_4)$  in the above inequalities, one has

$$\rho(T_2|T_1, S) \leq \frac{1}{4} \sum_i \rho(Y_i) + \frac{1}{4}(d[Y_1; Y_3] + d[Y_2; Y_4]) + \frac{1}{2}(d[T_2; T_2'] + \mathbb{1}(T_1 : T_2 | S))$$

and

$$\rho(T_2|T_1, S) \leq \frac{1}{4} \sum_i \rho(Y_i) + \frac{1}{4}(d[Y_1; Y_2] + d[Y_3; Y_4]) + \frac{1}{2}(d[Y_1|T_1; Y_3|T_1']).$$

Finally, take the sum of all four inequalities, apply Corollary 5.3 on  $(Y_1, Y_2, Y_3, Y_4)$  and  $(Y_1, Y_3, Y_2, Y_4)$  to rewrite the sum of last terms in the four inequalities, and divide the result by 2.  $\square$

**Lemma 13.36.** *For independent random variables  $Y_1, Y_2, Y_3, Y_4$  over  $G$ , define  $T_1 := Y_1 + Y_2, T_2 := Y_1 + Y_3, T_3 := Y_2 + Y_3$  and  $S := Y_1 + Y_2 + Y_3 + Y_4$ . Then*

$$\sum_{1 \leq i < j \leq 3} (\rho(T_i|T_j, S) + \rho(T_j|T_i, S)) - \frac{1}{2} \sum_i \rho(Y_i) \leq \sum_{1 \leq i < j \leq 4} d[Y_i; Y_j]$$

*Proof.* Apply Lemma 13.35 on  $(Y_i, Y_j, Y_k, Y_4)$  for  $(i, j, k) = (1, 2, 3), (2, 3, 1), (1, 3, 2)$ , and take the sum.  $\square$

**Proposition 13.37.** *If  $X_1, X_2$  is a  $\phi$ -minimizer, then  $d[X_1; X_2] = 0$ .*

*Proof.* Consider  $T_1 := X_1 + X_2, T_2 := X_1 + \tilde{X}_1, T_3 := \tilde{X}_1 + X_2$ , and  $S = X_1 + X_2 + \tilde{X}_1 + \tilde{X}_2$ . Note that  $T_1 + T_2 + T_3 = 0$ . First apply Lemma 13.34 on  $(T_1, T_2, T_3)$  when conditioned on  $S$  to get

$$\begin{aligned} d[X_1; X_2] &\leq \sum_{1 \leq i < j \leq 3} \mathbb{1}[T_i : T_j | S] + \frac{\eta}{3} \sum_{1 \leq i < j \leq 3} (\rho(T_i|T_j, S) + \rho(T_j|T_i, S) - \rho(X_1) - \rho(X_2)) \\ &= (I_1 + 2I_2) + \frac{\eta}{3} \sum_{1 \leq i < j \leq 3} (\rho(T_i|T_j, S) + \rho(T_j|T_i, S) - \rho(X_1) - \rho(X_2)). \end{aligned} \quad (13.1)$$

Then apply Lemma 13.36 on  $(X_1, X_2, \tilde{X}_1, \tilde{X}_2)$  and get

$$\sum_{1 \leq i < j \leq 3} (\rho(T_i|T_j, S) + \rho(T_j|T_i, S) - \rho(X_1) - \rho(X_2)) \leq (4d[X_1; X_2] + d[X_1; X_2] + d[X_2; X_2]) = 6d[X_1; X_2] + (I_2 - I_1)$$

by Lemma 13.31. Plug in the inequality above to (13.1), we get

$$d[X_1; X_2] \leq (I_1 + 2I_2) + 2\eta d[X_1; X_2] + \frac{\eta}{3}(I_2 - I_1).$$

By Lemma 13.32 we can conclude that

$$d[X_1; X_2] \leq 8\eta d[X_1; X_2] + \frac{3 + 4\eta}{3 - 3\eta}(2\eta d[X_1; X_2] - I_1).$$

Finally by Lemma 13.30 and  $\eta < 1$  we get that the second term is  $\leq 0$ , and thus  $d[X_1; X_2] \leq 8\eta d[X_1; X_2]$ . By the choice  $\eta < 1/8$  and the non-negativity of  $d$  we have  $d[X_1; X_2] = 0$ .  $\square$

**Proposition 13.38.** *For any random variables  $Y_1, Y_2$ , there exist a subgroup  $H$  such that*

$$2\rho(U_H) \leq \rho(Y_1) + \rho(Y_2) + 8d[Y_1; Y_2].$$

*Proof.* Let  $X_1, X_2$  be a  $\phi$ -minimizer. By Proposition 13.37  $d[X_1; X_2] = 0$ , which by Definition 13.28 implies  $\rho(X_1) + \rho(X_2) \leq \rho(Y_1) + \rho(Y_2) + \frac{1}{\eta}d[Y_1; Y_2]$  for every  $\eta < 1/8$ . Take the limit at  $\eta = 1/8$  to get  $\rho(X_1) + \rho(X_2) \leq \rho(Y_1) + \rho(Y_2) + 8d[Y_1; Y_2]$ . By Lemma 3.18 and Lemma 3.15 we have  $d[X_1; X_1] = d[X_2; X_2] = 0$ , and by Lemma 4.4 there are  $H_1 := \text{Sym}[X_1], H_2 := \text{Sym}[X_2]$  such that  $X_1 = U_{H_1} + x_1$  and  $X_2 = U_{H_2} + x_2$  for some  $x_2$ . By Lemma 13.19 we get  $\rho(U_{H_1}) + \rho(U_{H_2}) \leq \rho(Y_1) + \rho(Y_2) + 8d[Y_1; Y_2]$ , and thus the claim holds for  $H = H_1$  or  $H = H_2$ .  $\square$

**Corollary 13.39.** *If  $|A + A| \leq K|A|$ , then there exists a subgroup  $H$  and  $t \in G$  such that  $|A \cap (H + t)| \geq K^{-4}\sqrt{|A||V|}$ , and  $|H|/|A| \in [K^{-8}, K^8]$ .*

*Proof.* Apply Proposition 13.38 on  $U_A, U_A$  to get a subspace such that  $2\rho(U_H) \leq 2\rho(U_A) + 8d[U_A; U_A]$ . Recall that  $d[U_A; U_A] \leq \log K$  as proved in Lemma 7.2, and  $\rho(U_A) = 0$  by Lemma 13.17. Therefore  $\rho(U_H) \leq 4\log(K)$ . The claim then follows from Lemma 13.18.  $\square$

**Theorem 13.40** (PFR with  $C = 9$ ). *If  $A \subset \mathbf{F}_2^n$  is finite non-empty with  $|A + A| \leq K|A|$ , then there exists a subgroup  $H$  of  $\mathbf{F}_2^n$  with  $|H| \leq |A|$  such that  $A$  can be covered by at most  $2K^9$  translates of  $H$ .*

*Proof.* Apply Corollary 13.39 and Lemma 7.1 to get a variant of Lemma 7.2. The remaining part is the same as Theorem 7.3.  $\square$
